Camera User Guide / 30.09.2020

Version 5.0.1

Table of contents

1 LICENSE AGREEMENT

Please read the license agreement of this license contract carefully, before you install the software. By the installation of the software you agree to the conditions of this license contract.
This software-license agreement, in the following called “license”, contains all rights and restrictions for final users that regulate the use of the accompanying software, operating instructions and other documents, in the following called as “software”.

1. This license contract is an agreement between licensor and licensee, who is being licensed to use the named software.
2. Licensee acknowledges that this is only a limited nonexclusive license. This means, that the licensee has no right to allocate sublicenses. Licensor is and remains the owner of all titles, rights and interests in the software.
3. The software is a copyright property of the MAGNA Telemotive GmbH. The program or parts of it may not be further licensed to third parts, rented, sold or be further marketed in any form without explicit written approval by MAGNA Telemotive GmbH. The user may neither change the software and their components, nor modify, nor redevelop or decompile otherwise in any form.
4. This software is subject to no warranty. This software is sold as is, without any warranty. If at any time, a user changes his system, we hold no responsibility to change our software to make it work again.
5. This license permits licensee to install the software on more than one computer system, as long as the software will not be used on more than one computer system simultaneously. Licensee will not make copies of the software or allow copies of the software to be made by others, unless authorized by this license agreement. Licensee may make copies of the software for backup purposes only. Licensee is not entitled to transmit or to transfer the software or its rights from this license agreement.
6. Licensor is not liable to licensee for any damages, including compensatory, special, incidental, exemplary, punitive or consequential damages, connected with or resulting from this license agreement or licensee’s use of this software.
7. Licensee agrees to defend and indemnify licensor and hold licensor harmless from all claims, losses, damages, complaints or expenses connected with or resulting from licensee’s business operations.
8. Licensor has the right to terminate this license agreement and licensee’s right to use this software upon any material breach by licensee. The duration of the license contract is indefinitely determined.
9. Licensee agrees to return all copies of the software to licensor or to destroy them upon termination of the license contract.
10. This license agreement replaces and supersedes all prior negotiations, dealings and agreements between licensor and licensee regarding this software.
11. This license contract is subject to German law.
12. If a regulation of this license contract is void by law, the validity of the remaining regulations is not affected. If there is such a regulation it will be replaced by a valid, according to the legal regulations and enforceable regulation with similar intention and similar economic consequence.
13. The license contract is effective by delivery of the software of the licensor to the licensee and/or by usage of the software by the licensee. This license contract is also valid without licensor’s signature.
14. The license automatically goes out if the licensee does not agree to the license regulations described here or offend against the license regulations of this license contract. With ending the license contract the licensee is obliged to extinguish or to destroy the software and all copies of it no matter if installed or stored on disk or to hand all of it back to MAGNA Telemotive GmbH.
15. The licensee is liable for all damages caused to the licensor by the violation of these license regulations.

2 PRODUCT LIABILITY

2.1 Terms and Conditions of Sale and Delivery

The General Terms and Conditions of Sale and Delivery of MAGNA Telemotive GmbH can be found on our website (https://telemotive.magna.com) under imprint.

2.2 Important operating instructions

Please note these important instructions about the handling of devices of MAGNA Telemotive GmbH!

There's a linux system running on the devices and sometimes when the device has a dirty shutdown due to a power break down or unplugging the power supply, the system is corrupt from this time. You know this situation from a PC, when you switch it off some times it maybe will not work any more or show you some mistakes.

In most cases this issue is catched up and repaired by the linux system we use, but sometimes it can happen that the system on the logger is damaged and there's no access to the device any more.

We are optimizing the handling of corrupted systems permanently and are integrating some new enhancements regarding this kind of issues with every new release to save the system. But we can't make the system for 100% save against these influences.

So please use always the provided mechanism for shutting down the device or the implemented standby function in which the device shutting down when no traffic is detected any more in an adjustable time.

3 Overview

This user guide describes the installation and usage of a system for video recording. It consists of one network camera AXIS P12-series / F-series / 211 / 210 / 207 or a Video Encoder AXIS Q7404 / P7214 with analog cameras and a one of the data logger

- BLUEPIRAT Rapid
- BLUEPIRAT Mini
- BLUEPIRAT2 5E
- BLUEPIRAT2
- BLUEPIRAT Remote

of MAGNA Telemotive GmbH. The Video Encoders are used to connect analog cameras (NTSC/PAL). The network cameras can be connected directly to the data logger.

The system allows the recording of up to four different video streams at the same time. For that the server (or a network camera) and the data logger must be connected to each other and configured separately by a HTML-based client.

The video streams are recorded in real-time and in a specified time interval in the logger. They can be downloaded into a control unit for offline use. They can also be converted to a video file and transferred from the logger into a computer. The video block length can be adjusted to 15 up to 60 seconds and the videos are stored in the mpeg4 format.

Attention:
The Video Encoder and the cameras are not set by default to standby mode, which may be a reason for an empty battery.

After rebooting the system takes approximately 120 seconds to be synchronized. The recording starts immediately after the synchronization.
If the Ethernet cable was removed between the Video Encoder / camera and the data logger and plugged in again, the system takes around 11 seconds for the resynchronization.
If the supply voltage is removed from the Video Encoder / camera during the recording, it takes about 120 seconds to be synchronized (after a reconnection).

AXIS camera and Video Encoder should be operating within the AXIS specification. This is especially required for power and environmental parameters.

This user guide describes the configuration and usage of this feature. The general configuration is described in the user guides of the used data logger as well as the System Client, which is valid together.

This document refers to **firmware version 05.00.01** and the **System Client** from **version 5.0.1**. Some features depending on model and feature license or may not be available in older versions.

Software updates and user guides for other, optional, licensed enhancements are available in our Service Center. (Please find the address under Contact at the last page.)

To ensure the most reliable operation of your system as possible, please make sure to use always current firmware and software versions.

4 System requirements

Network camera AXIS P12 / F44 / F41 / 211 / 210 / 207
Network cameras have an Ethernet port and therefore can be connected directly to the data logger. Up to four cameras are supported to record the video streams. These cameras can be connected to the four channels of the encoder. The following AXIS camera types are supported: P12, F44, F41, 211, 210 and 207.

AXIS Q7404 / P7214 Video Encoder
The AXIS Video Encoder is a high performance, four-channel standalone device that integrates up to four analog cameras (NTSC/PAL) at a time into an IP-based video surveillance system. Video Encoder and camera are connected via BNC connector.
Both Video Encoders support the compression formats H.264, MJPEG and MPEG-4. Therefore they are capable to reduce bandwidth and storage requirements without compromising image quality.

The AXIS Q7404 Video Encoder contains four separate video channels, one for each video input. Each channel has its own IP address.
The AXIS P7214 Video Encoder uses only one IP address for all four channels.

The communication between bus systems and control units is monitored, and relevant data can be recorded very precisely with the data logger. The collected data are stored to the logger and can be downloaded via Ethernet to a PC.

Control Unit
You need a Windows based Laptop or PC to configure the devices by the **System Client**. It also allows to save the recorded data and to use them offline later.

System Client
Update, configure and read out your data loggers with System Client. Save time with central administration of your software products. System Client is your key to success for using all our products!

BLUEPIRAT Rapid
High-performance multi-bus data logger for modern vehicle architectures based on Automotive Ethernet. With up to 3 TB internal memory and supreme recording performance. Robust and compact for in-vehicle use.

Due to the increasing complexity of driver assistance systems and the growing number of infotainment applications, the data traffic between ECUs in the most recent vehicle models has grown significantly. Consequently, besides the various classic bus systems, modern vehicle architectures are based on Automotive Ethernet according to BroadR-Reach / IEEE 802.3 100(0)Base-T1, which can keep up with the growing bandwidth demand.

Power Backup
The **Power Backup** is a special component, which is designed to bridge short voltage interruptions. It is connected upstream of the data loggers on the voltage side, and must be connected to them via a dedicated LS CAN port for controlling.

BLUEPIRAT Mini
The **BLUEPIRAT Mini** is smallest data logger in the world with an outstanding functional scope. It offers a wide range of interfaces, stable temperature behavior, very low energy consumption,

four GBit Ethernet ports, and much more. Different blue PiraT Mini can be expanded flexibly to one cluster and therefore handled very easily by using System Link.

BLUEPIRAT2
The **BLUEPIRAT2** is our top-class all-in-one data logger. Seven models cover a wide range of interfaces. (Device is EOL)

BLUEPIRAT2 5E
Additionally, the **BLUEPIRAT2 5E** offers improved power management and power backup, five integrated Ethernet ports and super-fast start-up behavior. The BLUEPIRAT2 can be expanded flexibly via System Link. (Device is EOL)

Remote Control Touch (optional)
Operate your BLUEPIRAT data loggers safely and comfortably from the driver's or passenger seat. Via System Link our new remote control becomes part of your logger network. One remote control can handle all connected loggers.

BLUEPIRAT Remote (optional)
While Remote Control Touch is just a control unit for handling unique devices or a TSL network, the blue PiraT Remote additional has logger functionality by offering internal storage and some interfaces. (Device is EOL)

License
For the additional feature **Camera Link,** an installed license is required. Settings for licensed features can be performed with a valid license only.

If you need a license for your logger, please contact our sales department (please find the address under contact at the last page).

4.1 Accessing a connected camera / camera server

If the camera / camera server is connected to a data logger and has to be modified, it can be reached by the IP address of the logger and **port 11400**.

To access the configuration just put the IP address and port into your browser, e.g.:
192.168.0.233:11400

If there are more cameras / camera server connected, they can be reached by the ports 11401, 11402, 11403.

4.2 Further manuals

Beside this user Manual, we offer the main manuals for our System Client as well as for the different data logger generations in our Service Center at

https://sc.telemotive.de/bluepirat.

Our licensed enhancements have own manuals which are stored in the Service Center too. You will find a list of these enhancements in the user manuals in the chapter **Additional features by optional licenses**.

Under the following links, you always will find the latest versions:

User manual for the System Client
https://sc.telemotive.de/4/uploads/media/SystemClient_UserManual.pdf

User manual for BLUEPIRAT Rapid
https://sc.telemotive.de/4/uploads/media/BLUEPIRAT_Rapid_UserManual.pdf

User manual for BLUEPIRAT Mini
https://sc.telemotive.de/4/uploads/media/BLUEPIRAT_Mini_UserManual.pdf

User manual for Remote Control Touch
https://sc.telemotive.de/4/uploads/media/RCTouch_UserGuide.pdf

User manual for BLUEPIRAT Power Backup
https://sc.telemotive.de/4/uploads/media/BLUEPIRAT_Power_Backup_UserManual.pdf

User manual for BLUEPIRAT2 / BLUEPIRAT2 5E
https://sc.telemotive.de/4/uploads/media/BLUEPIRAT2_UserManual.pdf

User manual for BLUEPIRAT Remote
https://sc.telemotive.de/4/uploads/media/BLUEPIRAT_Remote_UserGuide.pdf

For having an easy access if necessary, the most important manuals are linked in the client under the menu item [Help] and are reachable easily from there.

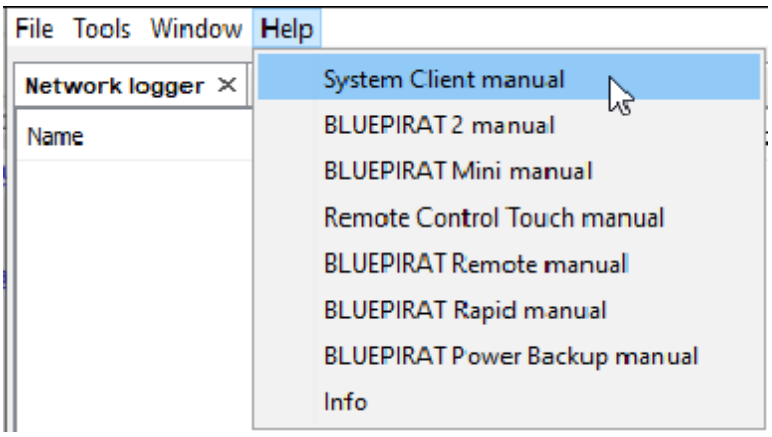

Figure 4.1: links to the manuals in the System Client

4.3 Additional features by optional licenses

Additional features can be activated by purchasing and installing licenses. Licenses can be ordered at our sales team. You find the user guides for these additional features in our Service Center. Currently the following licensed features are available.

Feature	Description
Camera Link	video recording via video server or network cameras Till now, only some cameras from AXIS were supported
WLAN	supporting wireless LAN / WiFi (802.11, 802.11a, 802.11n), *(802.11ac from FW 02.04.01)*
GPS logging	tracking of GPS data
Measurements with CCP	CAN Calibration Protocol
Measurements with XCP	Universal Measurement and Calibration Protocol Currently the functionality for Ethernet (XCP on Ethernet) and the CAN-bus (XCP on CAN) are available.
MOST150 Streaming	logging MOST150 synchronous/isochronous data
MLBevo / QXDM	The license Connected-Gateway MLBevo enables the recording of data of the ATOP control unit MLBevo via USB to the Magna Telemotive data logger and convert these data with the System Client. *(from FW 02.03.01)* Additional this license allows to log Qualcomm QXDM logs via USB *(from FW 03.06.XX)*
Download Terminal	The in the System Client integrated Download Terminal allows an automatization of configured tasks for a defined group of devices. *(from FW 02.03.01)*
Test automation	Interface for connecting to test automation tools. At the moment, the sending of CAN messages is supported. *(from FW 02.04.01)*
Cellular network	Allows the logger to send status messages over cellular network. *(from FW 03.01.01)*
Firmware Care	As part of the " Service Product Firmware Care ", new software and firmware versions are made available for download for a limited period of time. This service is available for 12 months from the date of purchasing the **BLUEPIRAT**. This period can be extended by licenses.

Table 4.1: Additional features by optional licenses

4.4 Firmware Care

MAGNA Telemotive GmbH invests a great amount in the further development of its products.

For this we regularly provide new functions and enhancements via firmware and client releases.

Basic conditions

As part of the " Service Product Firmware Care ", new software and firmware versions are made available for download for a limited period of time. This service is available for 12 months from the date of purchasing the **BLUEPIRAT**. This period can be extended.

For details, please contact your sales partner (see contact at the end of the manual for addresses).

Affected products

- **BLUEPIRAT Rapid**
- **BLUEPIRAT Mini**
- **Remote Control Touch**
- **BLUEPIRAT2 5E**
- **BLUEPIRAT2**
- **BLUEPIRAT Remote**

Note:
Enhancements are only possible in current firmware releases.

Attention:
Please note that updates to main firmware versions (05.00.01 / 06.00.01) need a special update license and can't be flashed to a device without this license.

To buy these licenses please contact our sales department under TMO.Sales@magna.com *(please find the complete address under Contact on the last page)*.

5 Configuring the network camera AXIS F54

More information about AXIS FA54 Main Unit you can also be found at:

https://www.axis.com/de-de/products/online-manual/32947

The following settings were made with AXIS firmware 10.0.2.

5.1 Connecting the network camera AXIS F54

Connect the camera with the associated main unit. Connect the power supply to the main unit. Connect your PC or laptop via Ethernet cable to the main unit. Turn o PC / Laptop pply. All three LEDs should light green after about 60 seconds.

Power supply (acc. AXIS-Spec.)

Figure 5.1 Connecting the network camera with a PC/ laptop

Change your PCs IP configuration. Use static IP address with the following settings:

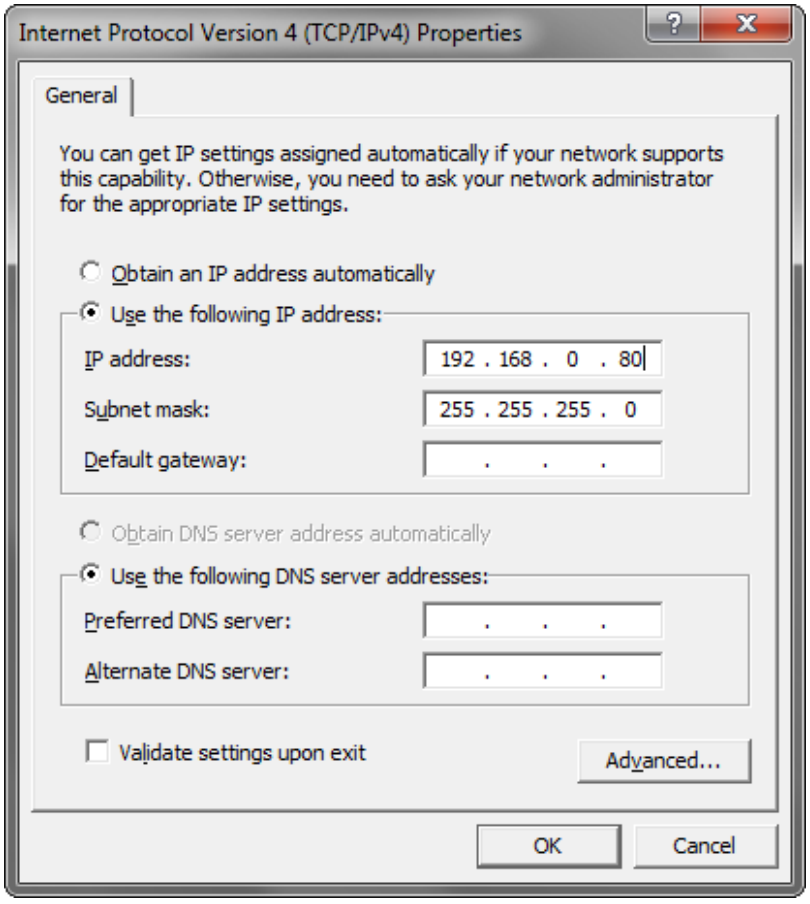

Figure 5.2 Setting a static IP address

5.2 Access to the network camera AXIS FA54

Open your Internet browser and enter the network camera's default IP address: 192.168.0.90.
Please refer to the instructions from AXIS regarding browser support:
https://www.axis.com/support/technical-notes/browser-support
The latest versions of Chrome and Firefox are recommended.

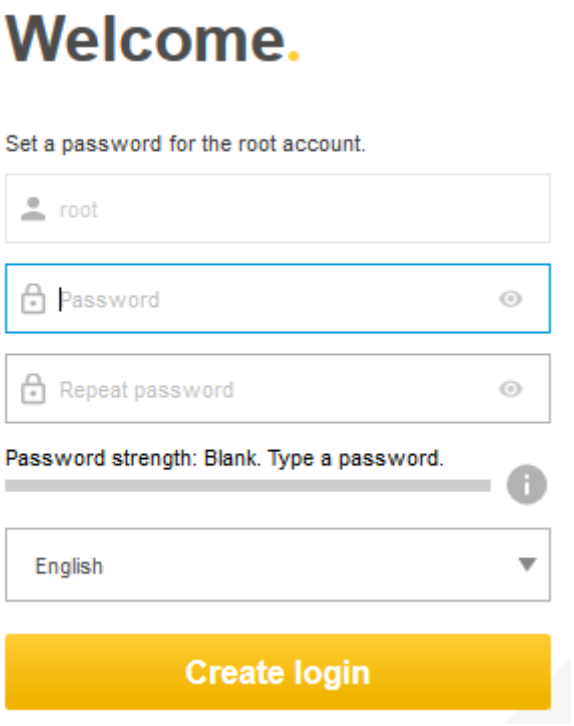

Figure 5.3 Initial login mask

Choose your password and type it in. This password will be needed later.
If the system asks for a further authentication, please type in the same password like before.

Thereafter you have to set the capture mode and the power line frequency of the power supply.
In Europe 50 Hz is common.

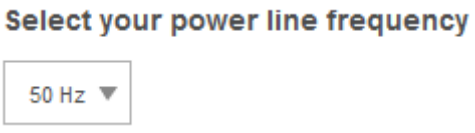

Figure 5.4 Select power line frequency

Set IP address to **192.168.1.90** and set date and time manually

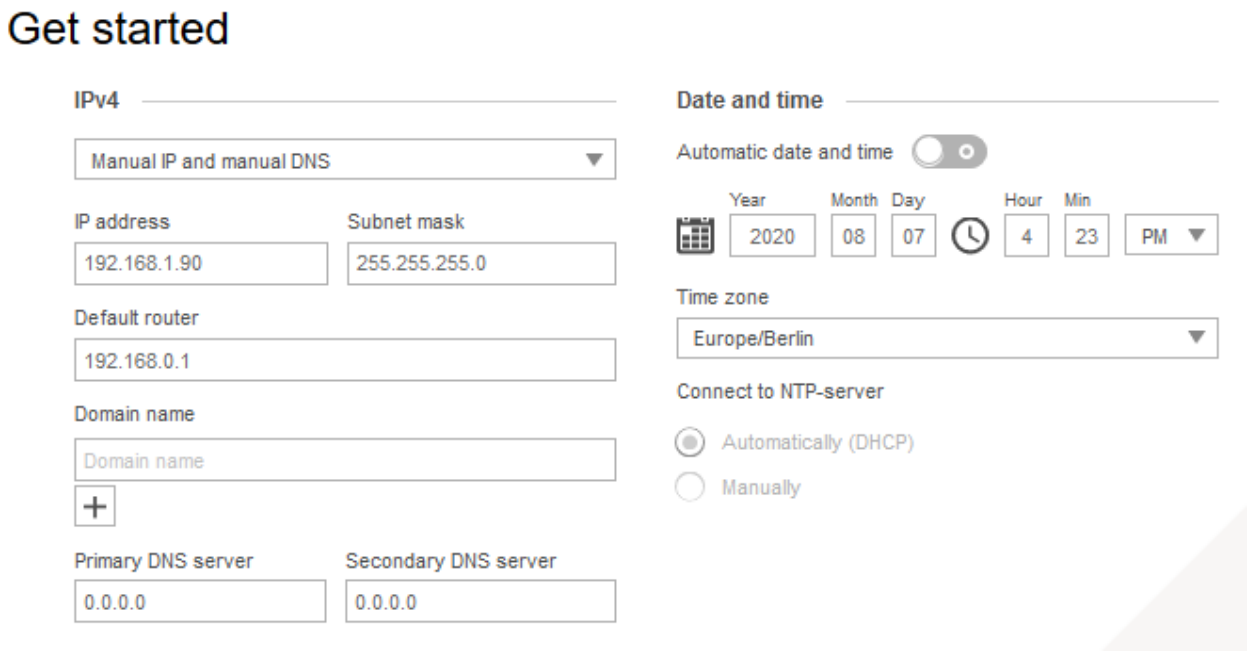

Figure 5.5 Defining the IP address and setting the date and time

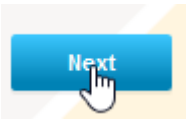
Comment:
The time set here is initially only a temporary adjustment. In our system the data logger is the time master and overwrites the logger time after successfully synchronizing with the video server.

Attention:
Before you start recording always set the date and time in the data logger first.
It is impossible to change the timestamp at recorded video data. This means, the setup of a new logger time before downloading does not change the time within the video pictures. In this case, the timestamps of the other channels and the video picture timestamp could not match.

Click on [next].



Hint:

If you change the IP address, you will lose the connection to the network camera.

To connect to the Main Unit again, change the IP address to **192.168.1.80** in the [Internet Protocol Version 4 (TCP/IPv4) Properties] window of your computer.

5.3 Creating the „admin“ user

Now enter the IP address 192.168.1.90 in the browser:

Enter the user name root and the password you entered before.

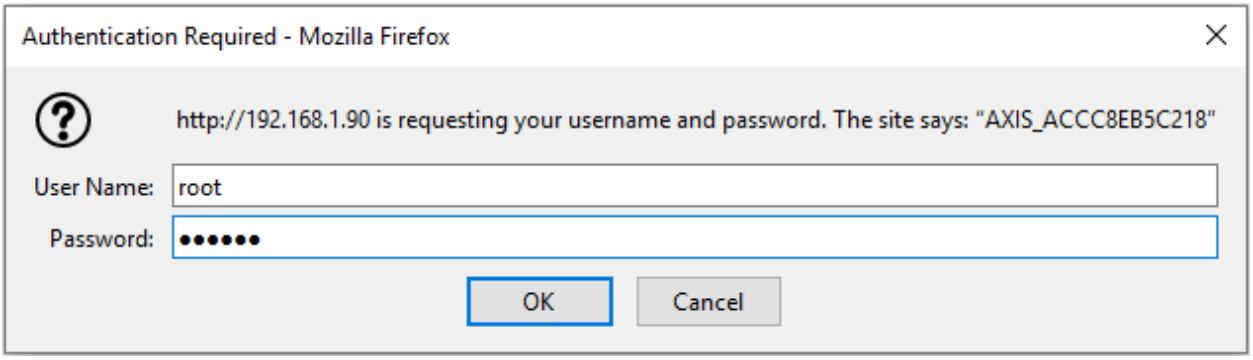


Figure 5.6 Login to the Main Unit after changing the IP address

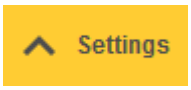
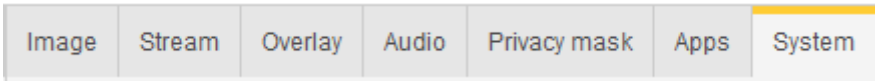
Click on the [Done] button at the bottom right

Then the [Settings] button will also appear in the bottom right-hand corner, please click on it:



In the window that opens, click on the [System] tab.



Here on [Users]:

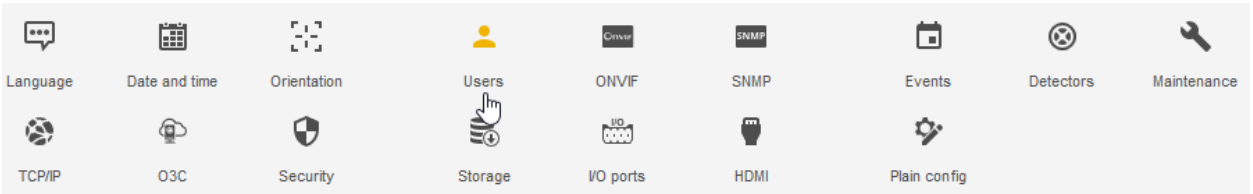


Figure 5.7 Select the Users menu

There you create a new user "Admin" in the role of the administrator by clicking on the "+" sign.

Important!

Please enter as password **2x8bg4**

Username	**admin**
Password	**2x8bg4**

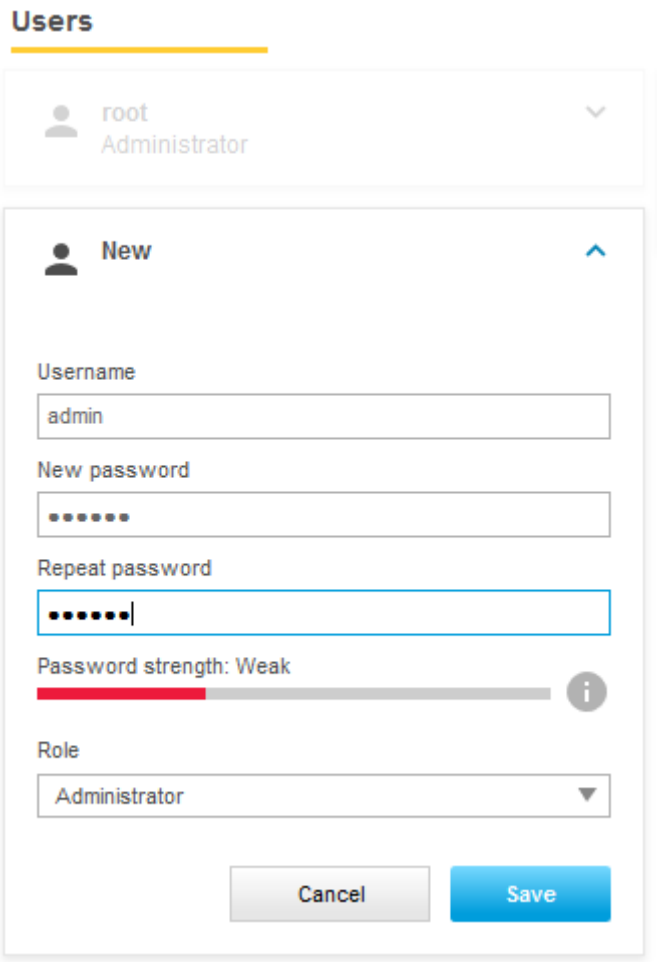

Figure 5.8 Create new user Admin

After entering the password click on [Save].

Now two users root and Admin should appear in the user menu.

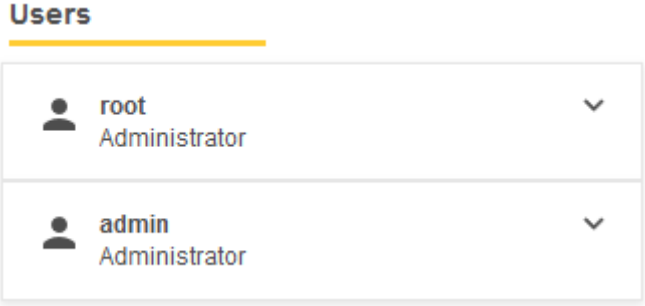

Figure 5.9 Created users

In the Anonymous Users field, move the slider to the right to allow anonymous users.

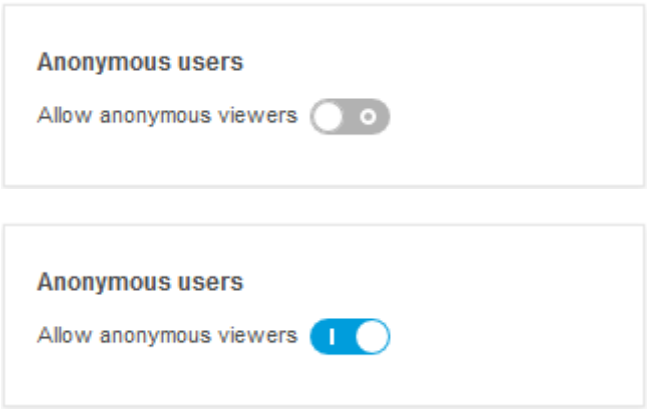

Figure 5.10 Anonymous Users field

and confirm the note by clicking the [Yes] button.

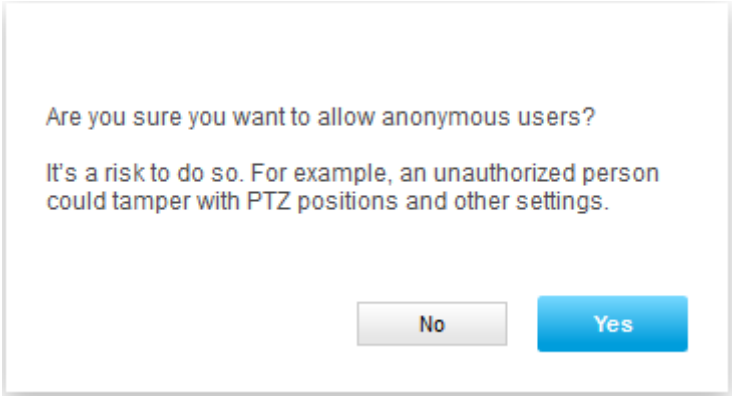

Figure 5.11 Note Allow anonymous users

5.4 Further system settings

5.4.1 RTSP (Real-Time Streaming Protocol)

Please check that the following setting is set:

On the System tab, click on [Plain config].

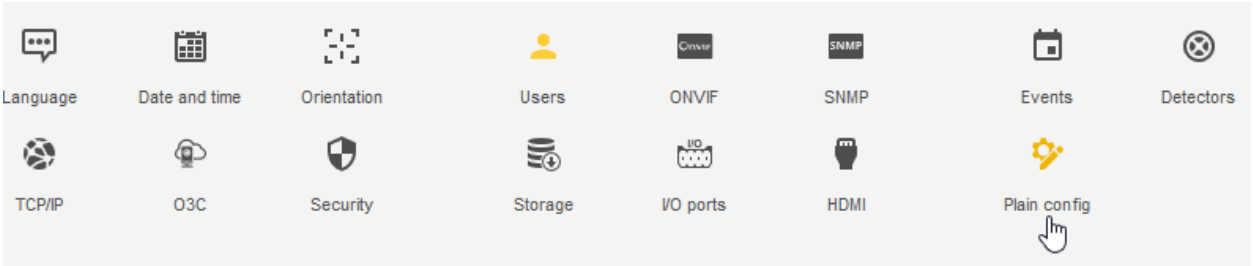

Figure 5.12 Selection menu

Click on the [Got it] button in the message that now appears

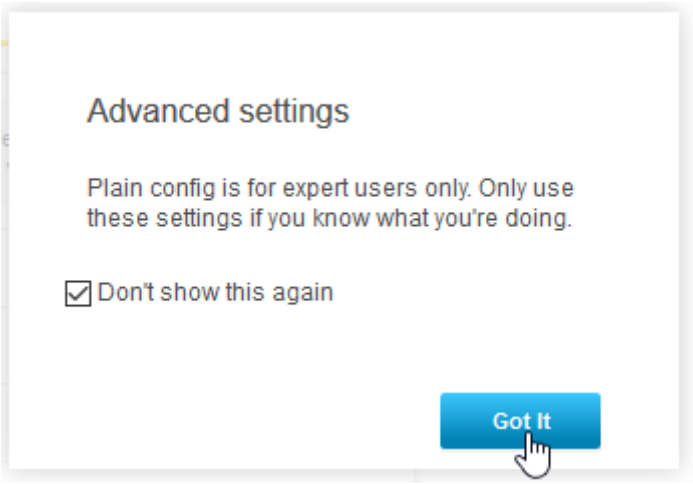

Figure 5.13 Confirmation query Advanced settings

To check whether the correct settings are set, scroll down in the offered selection menu "Plain-config" and click in the line [Network]

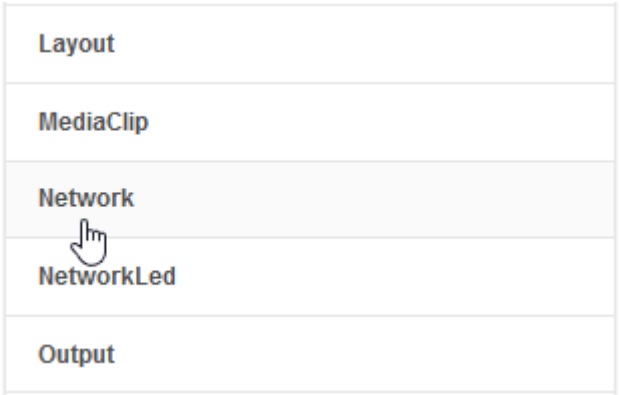

Figure 5.14 Selection menu Simple Config

In the opened window scroll down almost completely to RTSP. The following settings should be made there:

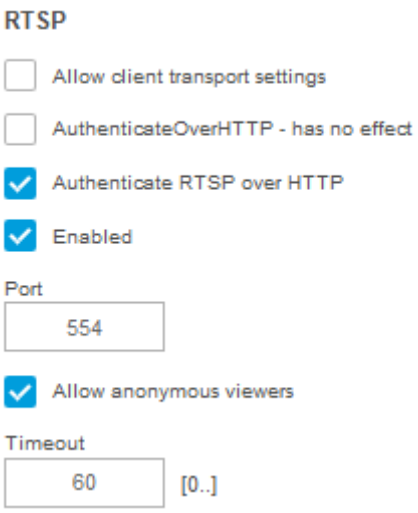

Figure 5.15 RTSP Menu

5.4.2 Displaying the date and time in the video image

These settings must be made individually for each camera.

To select a camera, click on the corresponding camera in the Start menu screen.

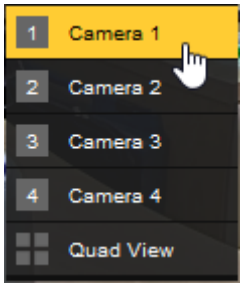

Figure 5.16 Camera selection Menu

Go to the [Overlay] tab

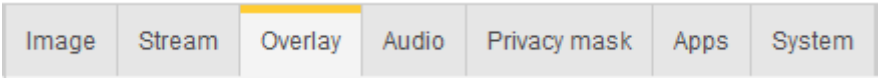

Figure 5.17 Settings menu

Click on [Create overlay]

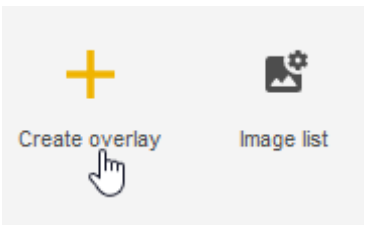

Figure 5.18 Select Create Overlay

Select [Create] from the Create Overlay menu

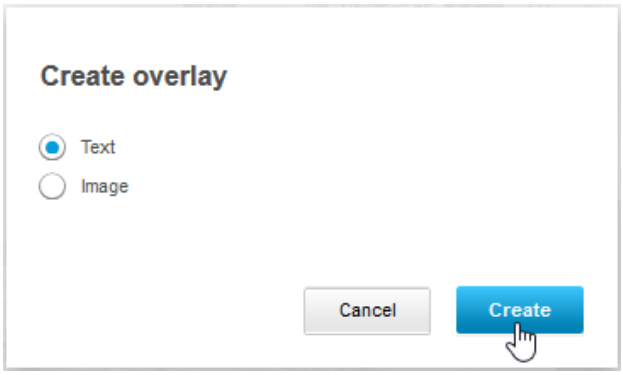

Figure 5.19 Menu Overlay

Click on the date and time to display them in the image.

You can also set the desired formatting here.

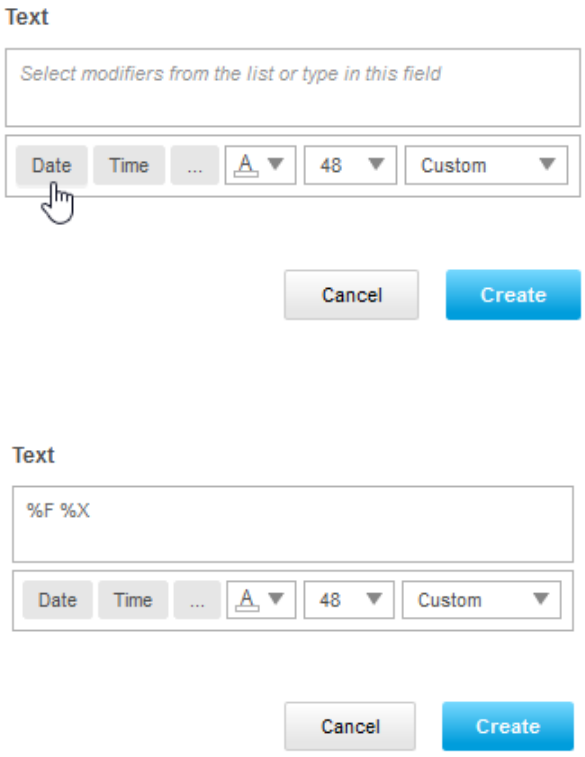

Figure 5.20 Text input in the Overlay menu

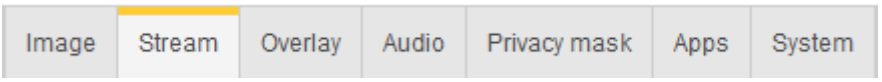
Finally click on the button [Create].

Attention:
Before you start recording always set the date and time in the data logger first.
It is impossible to change the timestamp at recorded video data. This means, the setup of a new logger time before downloading does not change the time within the video pictures. In this case, the timestamps of the other channels and the video picture timestamp could not match.

5.4.3 Stream settings

Click on the [stream] tab.



The following settings can be made here:

Figure 5.21 Stream settings

Note:
In case that the video is stuttering or has breaks, please reduce the preset <Maximum frame rate>. Reducing to 15 or 20 fps eliminates the problem which is caused by to high frame rates especially with HD cameras.

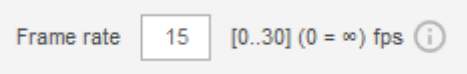


Figure 5.22 Frame rate settings

Up to two microphones can be connected to the Main Unit. To include an audio recording in the video stream, click the [Include Audio] slider and select the desired audio input:

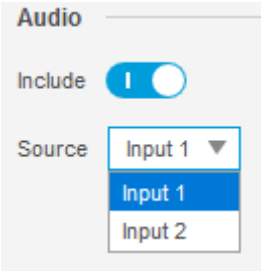

Figure 5.23 Include audio in the video stream

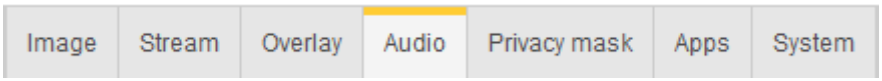
5.4.4 Audio setting

To enable audio, select the [Audio] tab.



Make the desired settings here.

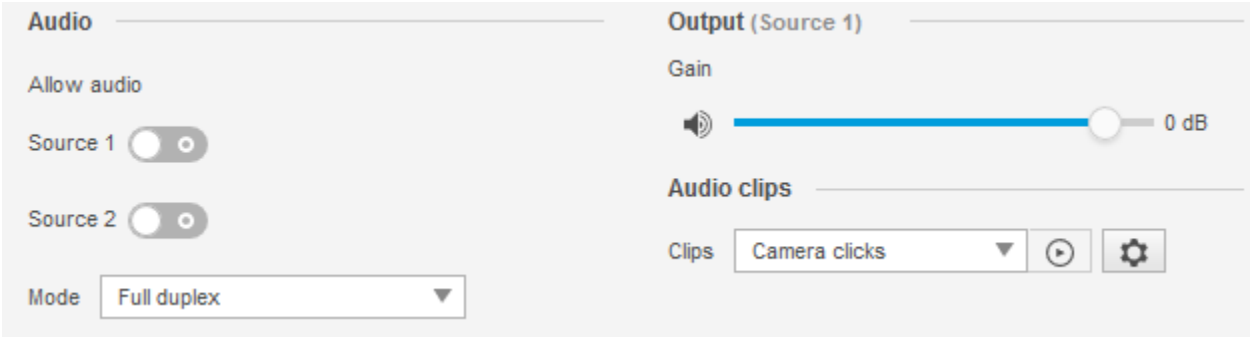


Figure 5.24 Audio settings menu

Further settings can be made by selecting the audio source.

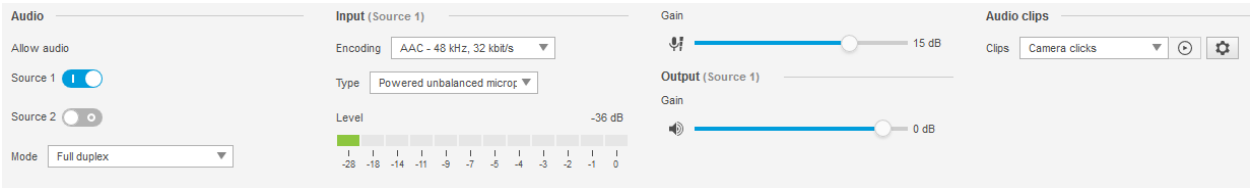

Figure 5.25 Further audio source settings

The audio quality can still be adjusted with the [Encoding] settings

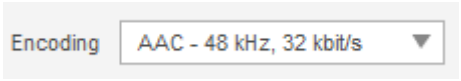

Figure 5.26 Setting the audio quality

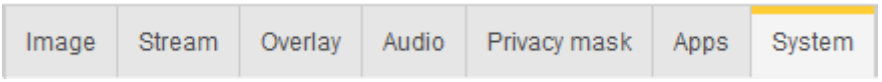
Hint:
When you have made all settings, please set the IP settings of your PC or laptop back to dynamic IP address.

5.5 System Maintenance

For system maintenance please click on the menu item [System].



Click on the [Maintenance] icon there

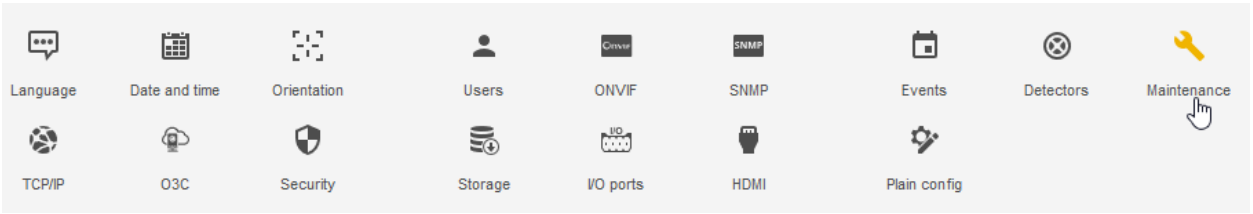


Figure 5.27 System menu

Various system tasks can be performed in the System / Maintenance menu, including resetting to factory settings and an update or downgrade of the firmware.

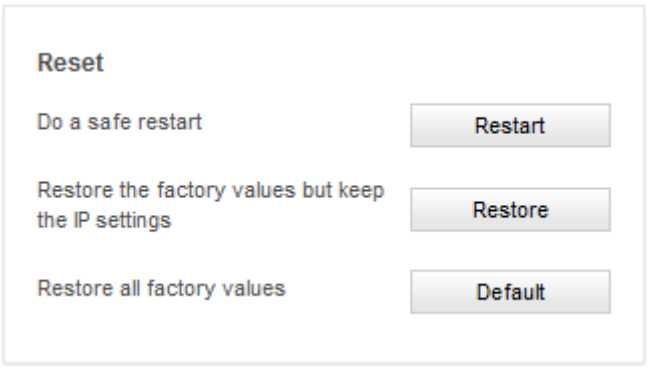

Figure 5.28 Reset to factory settings

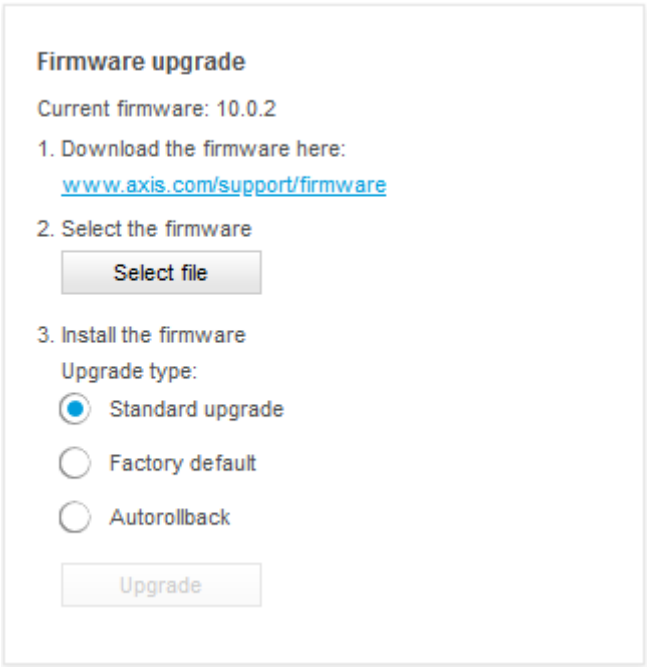

Figure 5.29 Firmware upgrade

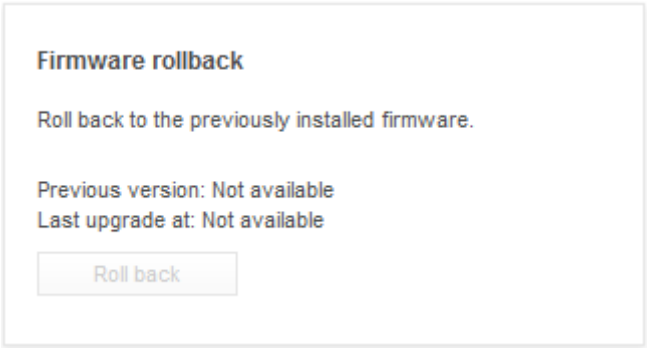

Figure 5.30 Firmware rollback

5.6 Reset to factory settings

In addition to the procedure described above, you can also reset the Main Unit to the factory settings as follows:

1. Disconnect power from the product.
2. Hold down the control button between the two SD card slots on the right side and
3. Reconnect the power supply.
4. Keep the control button pressed for 15–30 seconds until the status LED indicator flashes amber.
5. Release the control button.
6. The process is complete when the status LED indicator turns green. The product has been reset to the factory default settings.

6 Configuring the network camera AXIS F41/F44

6.1 Connecting the network camera AXIS F41/F44

Connect the camera with the associated main unit. Connect the power supply to the main unit. Connect your PC or laptop via Ethernet cable to the main unit. Turn on the power supply. All LEDs should light green after about 60 seconds.

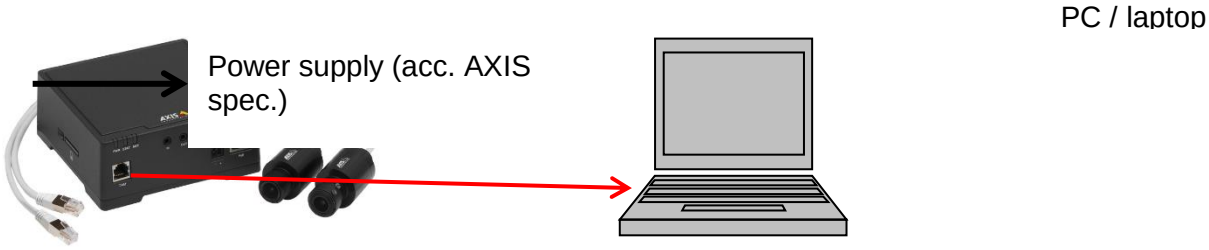

Figure 6.1: Connecting the network camera with a PC/ laptop

Change your PCs IP configuration. Use static IP address with the following settings:

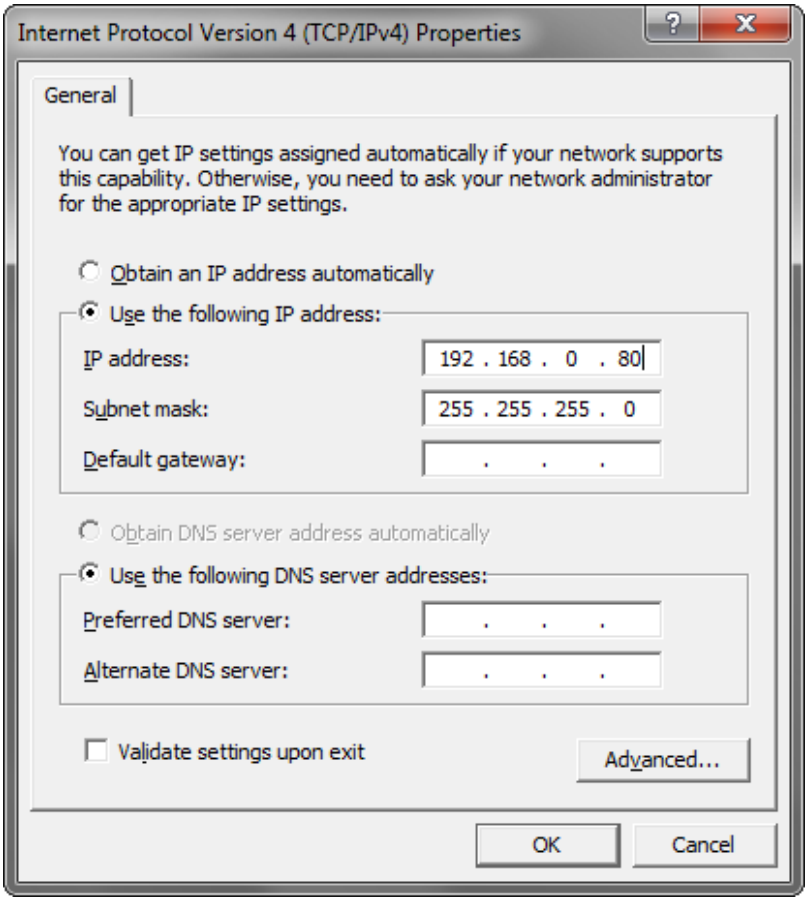

Figure 6.2: Setting a static IP address

Index

6.2 Access to the network camera AXIS F41/F44

Open your browser and type in the preset IP address of the network camera: **192.168.0.90**.

Choose your password and type it in. This password will be needed later.
If the system asks for a further authentication, please type in the same password like before.

Figure 6.3: Creating an user password

After setting the password please login to the AXIS F41/F44 web interface:

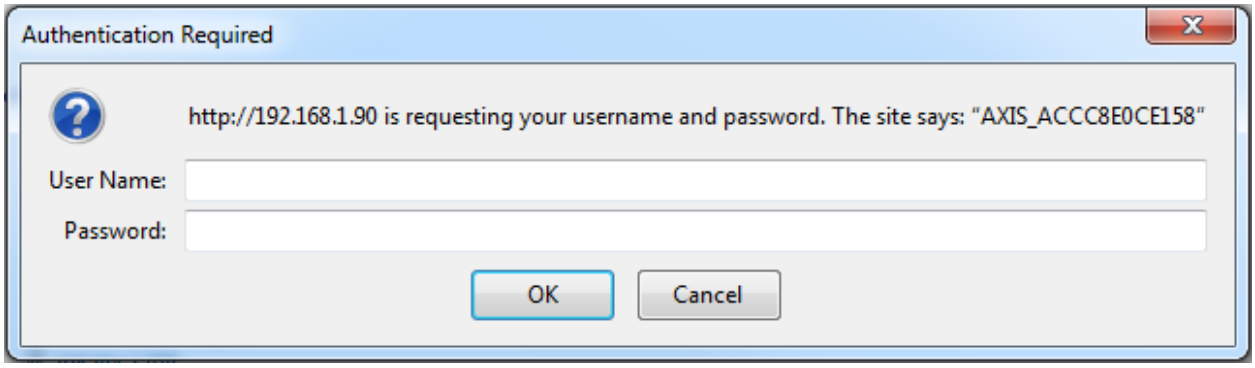

Figure 6.4: Login to the web interface

User name: root

Password: (your chosen password from before)

In some cases a browser add-on is necessary to display the video stream.

Thereafter you have to set the capture mode and the power line frequency of the power supply. In Europe 50 Hz is common.

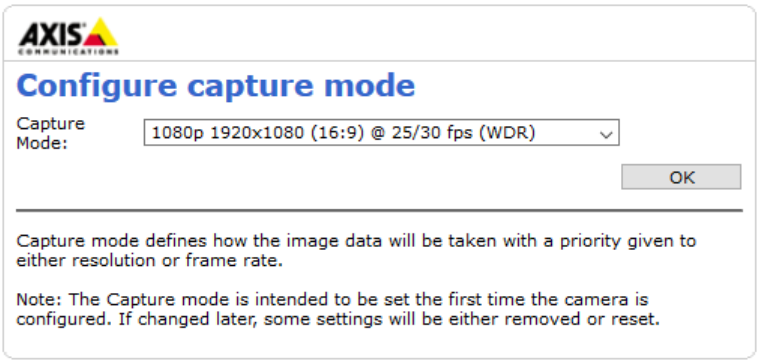

Figure 6.5: Configure the capture mode F41

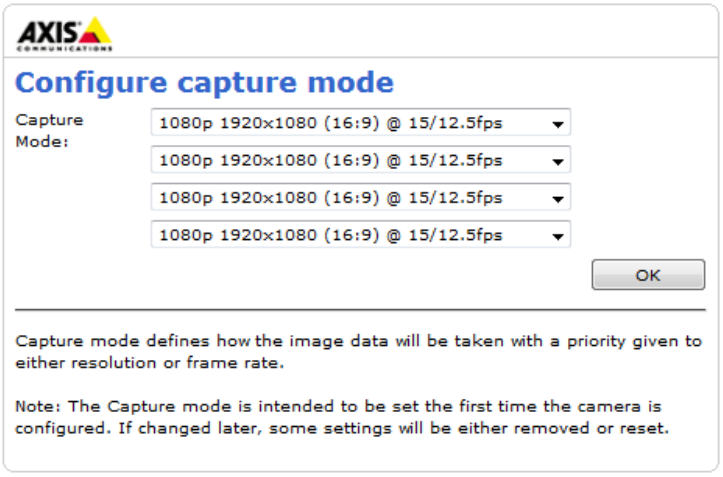

Figure6.6: Configure the capture mode F44

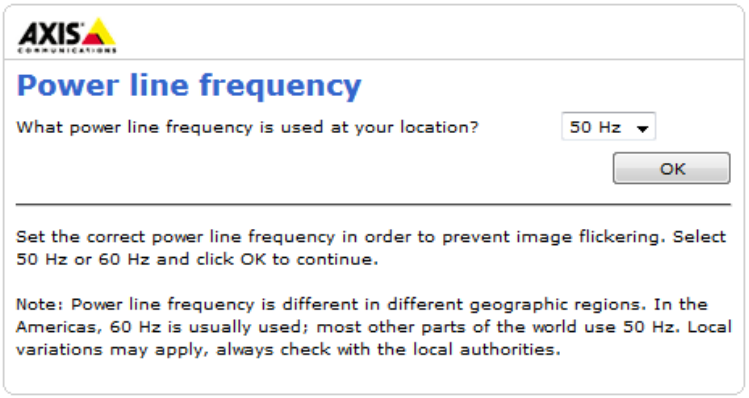

Figure 6.7: Configure the power line frequency

Now you should see the live stream of the connected network camera.

Figure 6.8: Picture of a connected network camera

Index

6.3 Creating the user “admin”

For communicating with the data logger a special user is needed with administrator rights.

Click **[Setup]** → **[Basic Setup]** → **[1 Users]** → **[Add…]**.

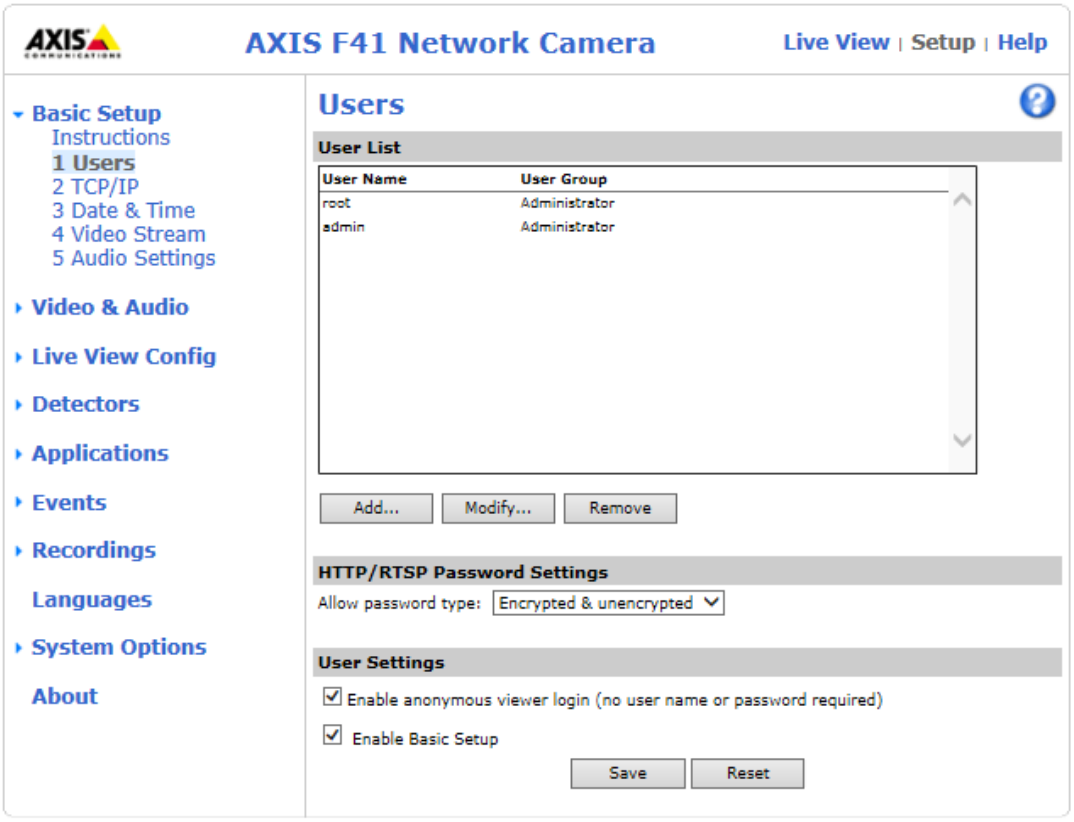

Figure 6.9: Adding a new user

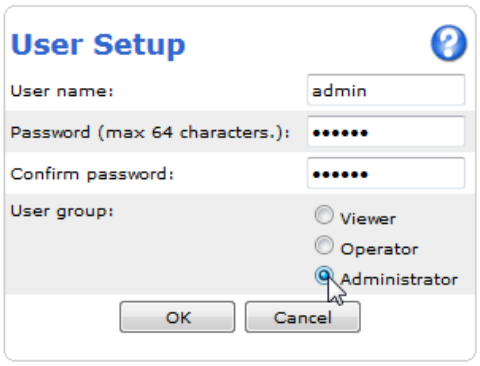
A new window is opened.



Name the new user “admin” and define a password. This user and password will be needed later too.

Recommended:
User name: admin
Password: 2x8bg4

Choose the <User group> **(o) Administrator** and click **[OK]**.

Activate at <User Settings> the checkbox **Enable anonymous viewer login (no user name or password required)**. Confirm the settings with **[Save]**.

Figure 6.10: Enable anonymous viewer login

6.4 Setting date and time

Change to the entry **[Basic Setup]** → **[3 Date & Time]**. Choose the <Time mode> **(o) Set manually**. Set up date and time. Confirm the settings with **[Save]**.

Comment:
The time set here is initially only a temporary adjustment. In our system the data logger is the time master and overwrites the logger time after successfully synchronizing with the video server.

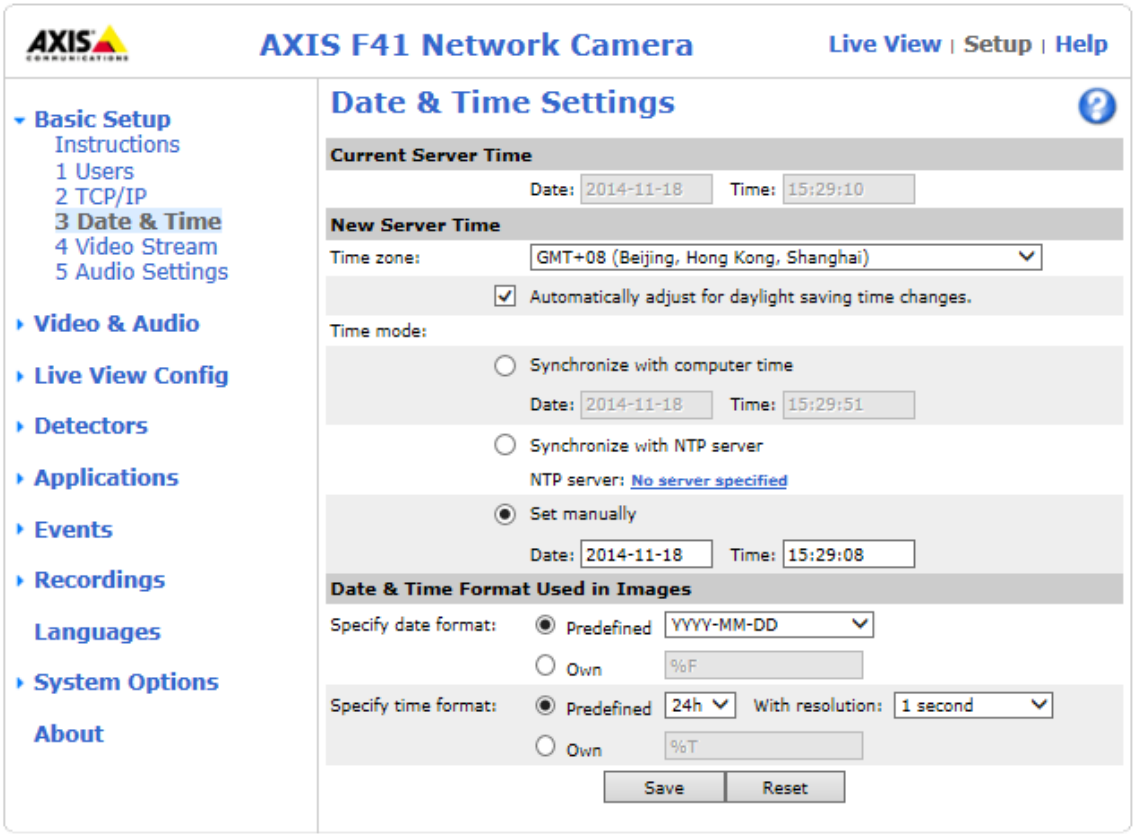


Figure 6.11: Set date and time manually

You can also display date and time on the video image.

Attention:
Before you start recording always set the date and time in the data logger first.
It is impossible to change the timestamp at recorded video data. This means, the setup of a new logger time before downloading does not change the time within the video pictures. In this case, the timestamps of the other channels and the video picture timestamp could not match.

Click **[Basic Setup]** → **[4 Video Stream]**. Activate both checkboxes **Include date** and **Include time** to activate the display on the video image. Confirm the settings with **[Save]**.

If desired, change format options like <Text color>, <Text background color> and text place. Confirm the settings with **[Save]**.

Note:
Using the AXIS F44 these settings must be made for Camera 1 to 4.

[Basic Setup] → [4 Video Stream] → [Camera …]

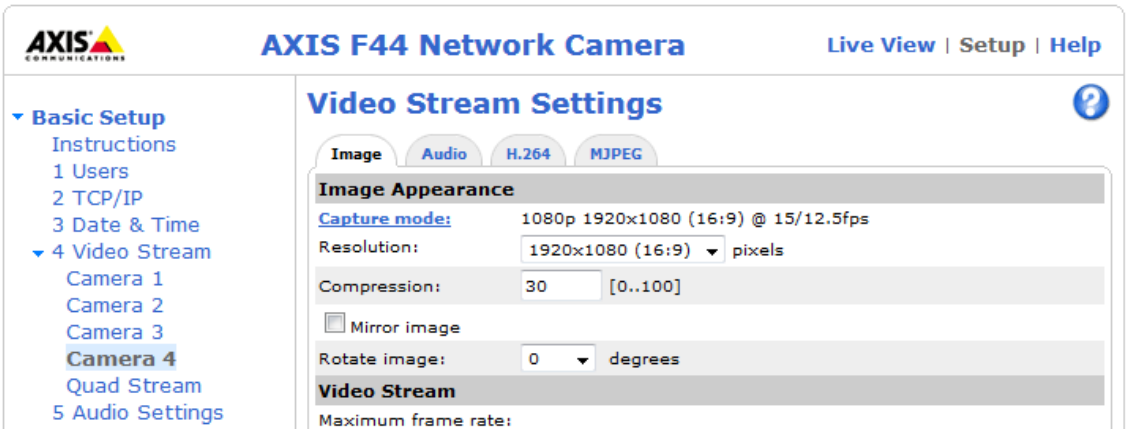

Figure 6.12: Settings for cameras 1 - 4

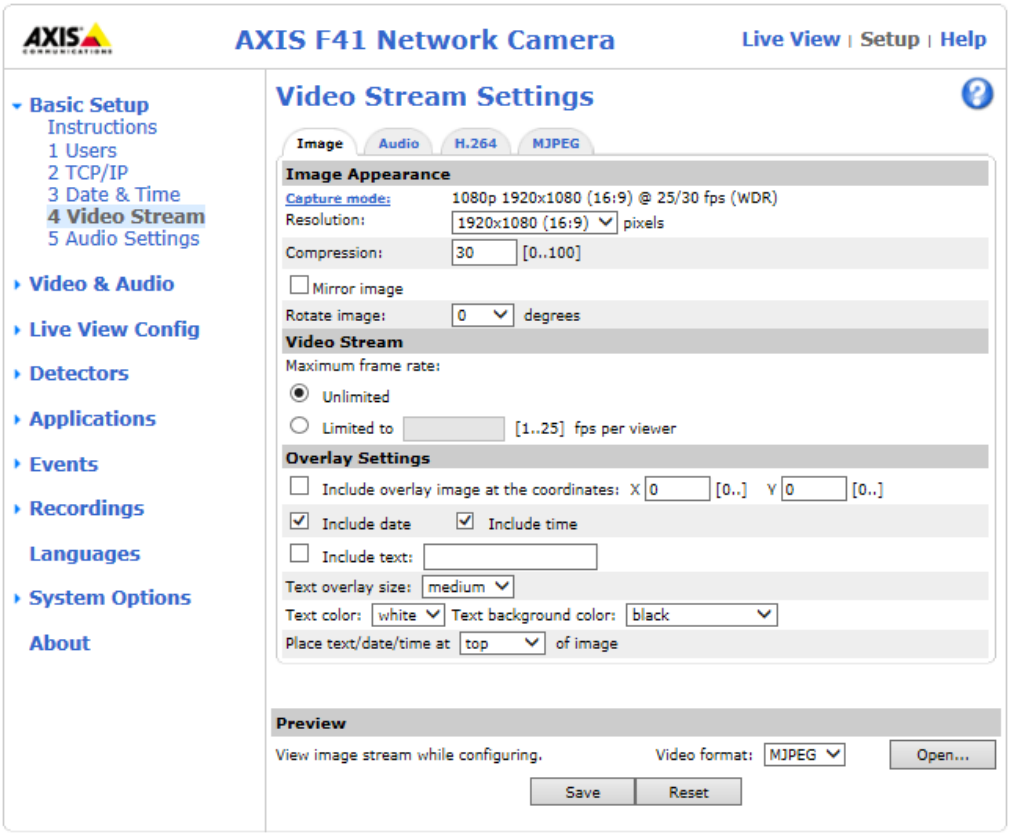

Figure 6.13: Include date and time in the video stream

The setup for in the video image embedded timestamps is finished.

Note:
In case that the video is stuttering or has breaks, please reduce the preset <Maximum frame rate>. Reducing to 15 or 20 fps eliminates the problem which is caused by to high frame rates especially with HD cameras.

Index

6.5 Audio settings (FW 2.0.1 onwards)

Change to **[Basic Setup]** → **[4 Video Stream]** and switch to the tab **[Audio]**. Activate the checkbox **Enable audio** to enable the general audio functionality.

Note:
Using the AXIS F44 these settings must be made for Camera 1 to 4.
[Basic Setup] → [4 Video Stream] → [Camera …]

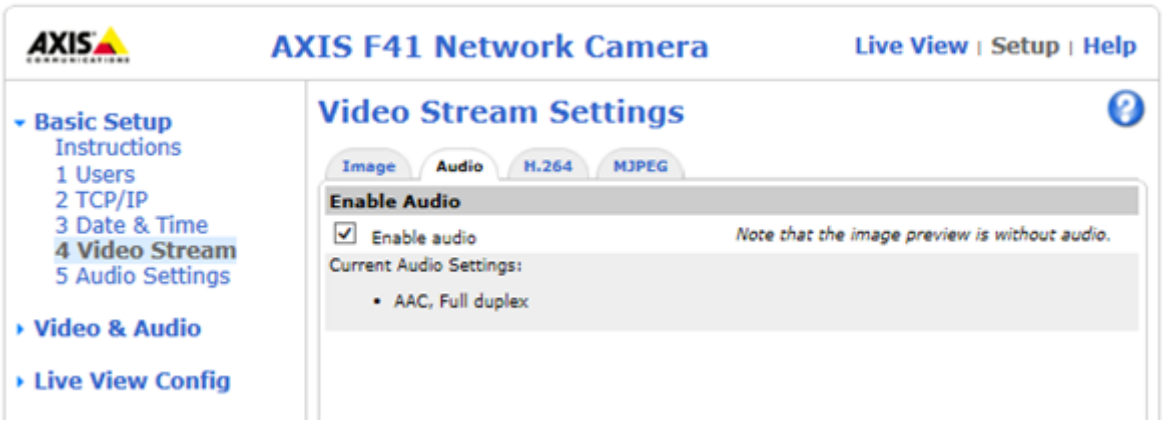

Figure 6.14: Enable audio

6.5.1 Adjusting audio source

Change to the entry **[Video & Audio]** → **[Audio Settings]**. Here you can configure the connected source as well as the recorded audio quality.

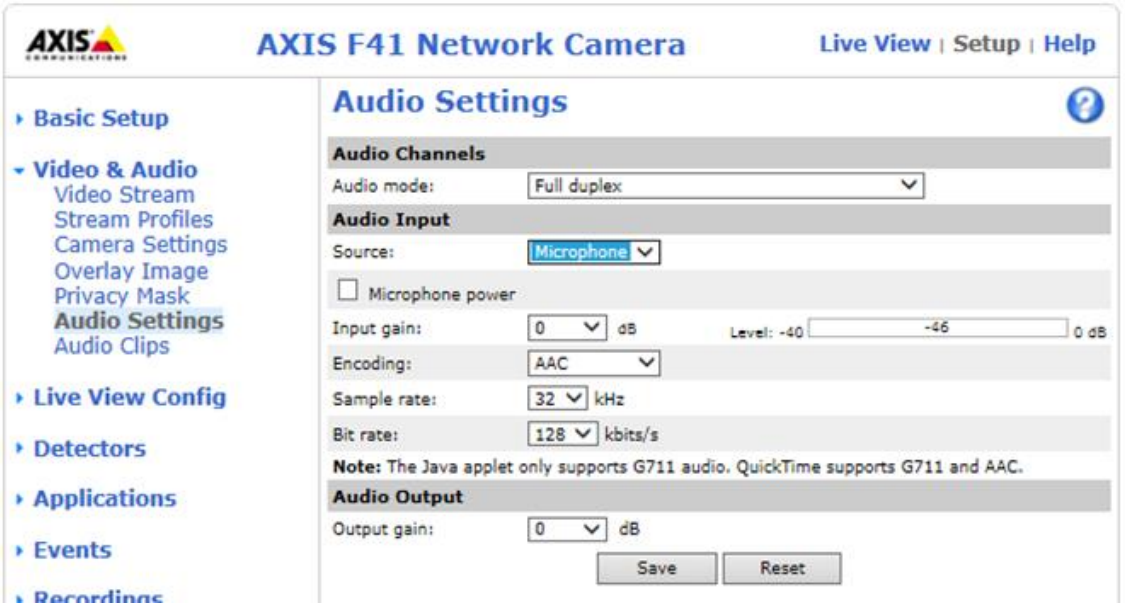

Figure 6.15: Configure audio settings

In the dropdown box next to <Source> you can choose between **[Line]** for an audio source like an MP3 player and **[Microphone]**.

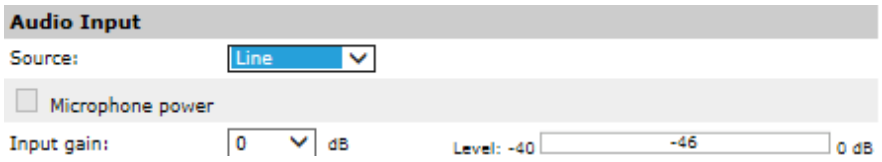

Figure 6.16: Select audio input (Line)

The source **[Microphone]** supports additionally the functionality to power a microphone.

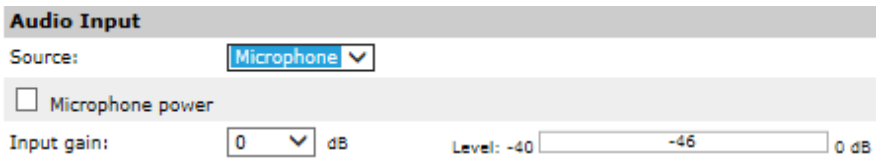

Figure 6.17: Select audio input (Microphone)

The setting of the <Input gain> can be used to configure an internal preamplifier for signal improvement.

Note:
If the source configuration is not valid the audio signal may be distorted.

6.5.2 Adjusting audio quality

For a high audio quality we recommend to configure the <Sample rate> and the <Bit rate> at the highest value. The <Encoding> is left by default (AAC).

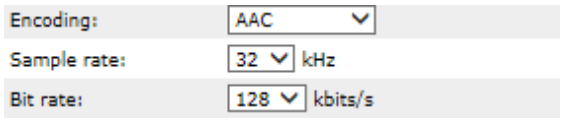

Figure 6.18: Adjust audio quality

Index

6.6 IP configuration

Change to the entry **[Basic Setup]** → **[2 TCP/IP]**. Choose the <IPv4 Address Configuration> **(o) Use the following IP address**. Type in these data:

IP address:	192.168.1.90
Subnet mask:	255.255.255.0

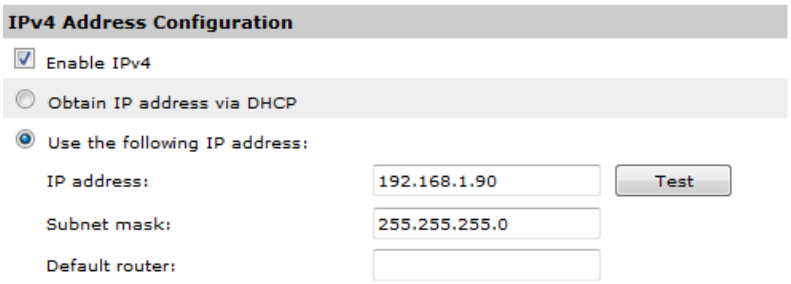

Figure 6.19: Setting an IP address

Confirm the settings with **[Save]**.

Note:
By changing the IP address you lose the connection to the network camera.

This also will be told to you in an information window:

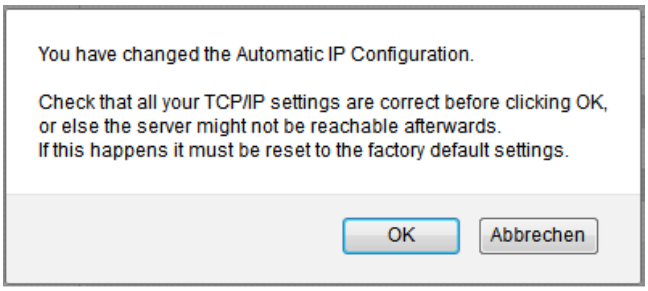

Figure 6.20: Hint 1

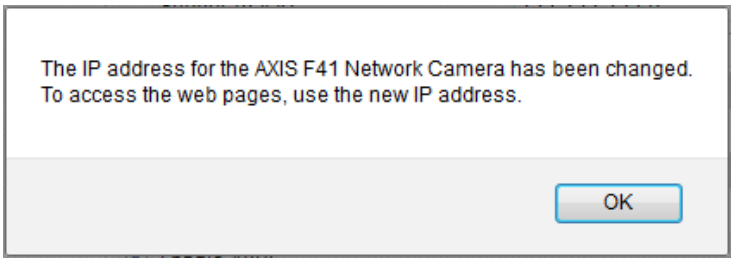

Figure 6.21: Hint 2

For reconnecting you have to change your computers IP address to **192.168.1.80**. Then type in your browser the new IP address of the network camera, to access the configuration again.

Note:
Finally, change your PCs or laptops IP configuration back to dynamic configuration.

Index

6.7 Resetting configuration

The camera AXIS F41/F44 can be set to default settings by the following steps:

1. Disconnect the connection to the power supply.
2. Press and hold the control button next to the SD slot and
3. reconnect to the power supply.
4. Hold the control button for 15 to 30 seconds till the Stat-LED flashes yellow.

When the Stat-LED turns green the process is finished.

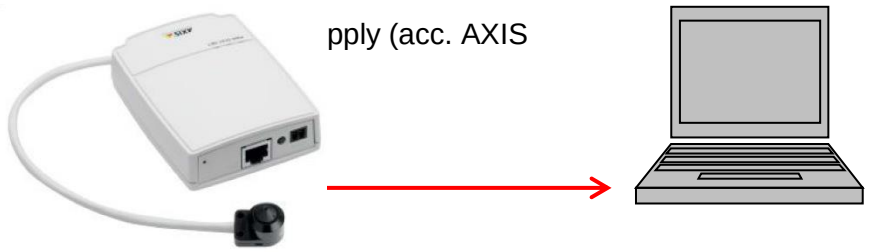
7 Configuring the network camera AXIS P12xx

7.1 Connecting the network camera AXIS P1204 / P1214 / P1224

Connect the camera with the associated main unit. Connect the power supply to the main unit. Connect your PC or laptop via Ethernet cable to the main unit. Turn on the power supply. All LEDs should light green after about 60 seconds.

Network camera AXIS P1204 / P1214 / P1224

PC / Laptop



pply (acc. AXIS

Change your PCs IP configuration. Use static IP address with the following settings:

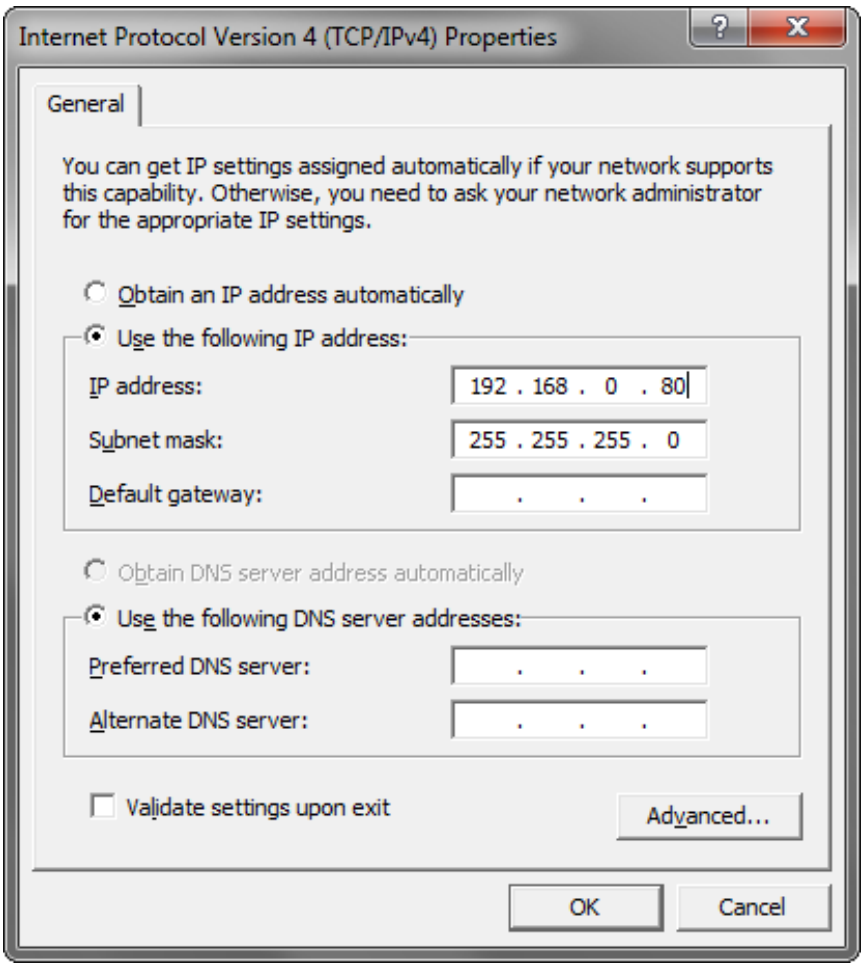


Figure 7.1: Setting a static IP address

7.2 Access to the network camera AXIS P12xx

Open your browser and type in the preset IP address of the network camera: **192.168.0.90**.
(http://192.168.0.90)

Choose your password and type it in. This password will be needed later.
If the system asks for a further authentication, please type in the same password like before.

Figure 7.2: Create a user password

After setting the password please login to the web interface:

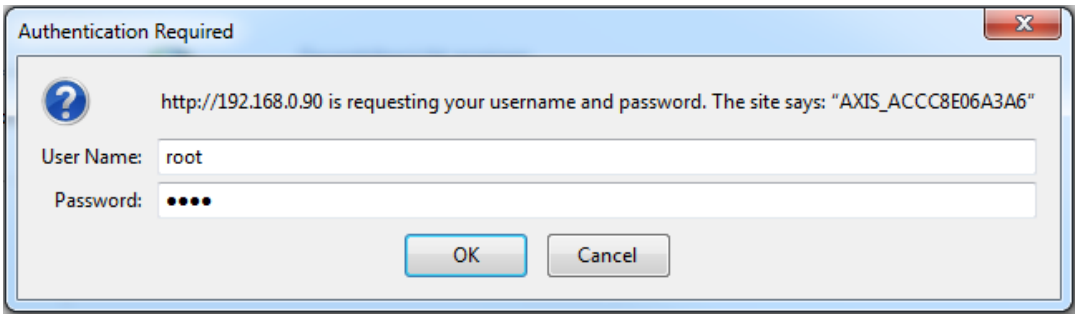

Figure 7.3: Login to the web interface

User name: root

Password: (your chosen password from before)

A browser add-on is necessary to display the video stream in some cases.

Thereafter you have to set the power line frequency of the power supply. In Europe 50 Hz is common.

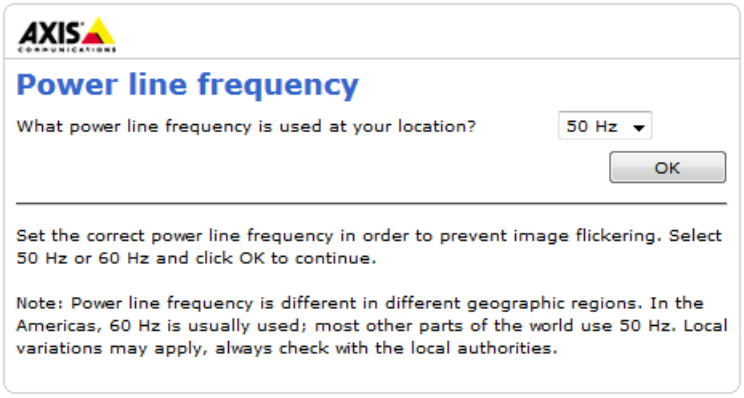

Figure 7.4: Configure the power line frequency

Now you should see the live stream of the connected network camera.

Figure 7.5: Picture of a connected network camera

7.3 Creating the user “admin”

For communicating with the blue data logger a special user is needed with administrator rights.

Click **[Setup]** → **[Basic Setup]** → **[1 Users]** → **[Add…]**.

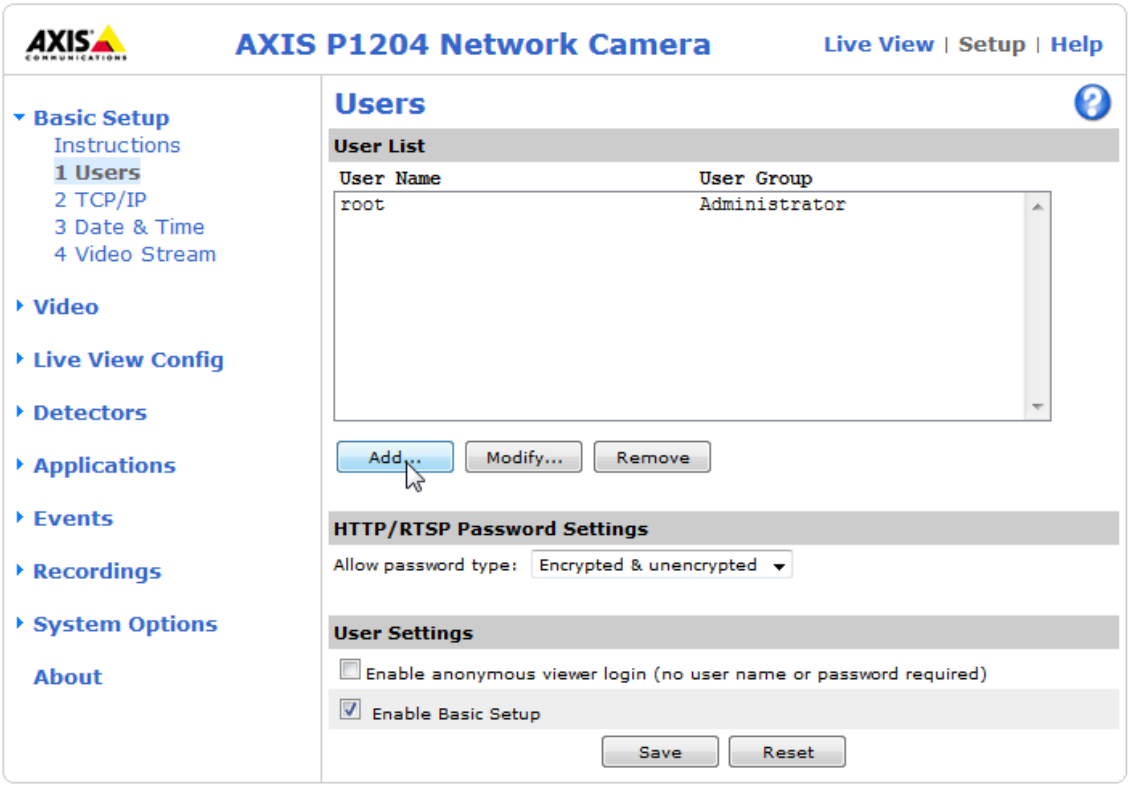

Figure 7.6: Add a new user

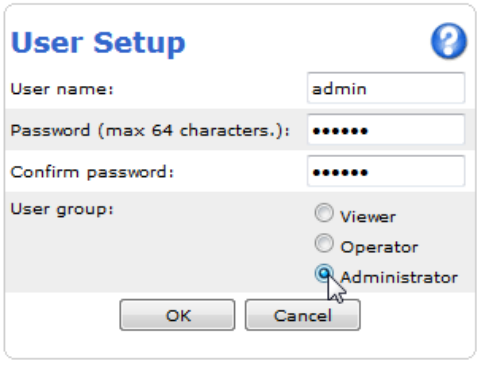
A new window is opened.



Name the new user “admin” and define a password. This user and password will be needed later too.

Recommended:
User name: admin
Password: 2x8bg4

Choose the <User group> **(o) Administrator** and click **[OK]**.

Activate at <User Settings> the checkbox **Enable anonymous viewer login (no user name or password required)**. Confirm the settings with **[Save]**.

Figure 7.7: Enable anonymous viewer login

7.4 Setting date and time

Change to the entry **[Basic Setup]** → **[3 Date & Time]**. Choose the <Time mode> **(o) Set manually**. Set up date and time. Confirm the settings with **[Save]**.

Comment:
The time set here is initially only a temporary adjustment. In our system the data logger is the time master and overwrites the logger time after successfully synchronizing with the video server.

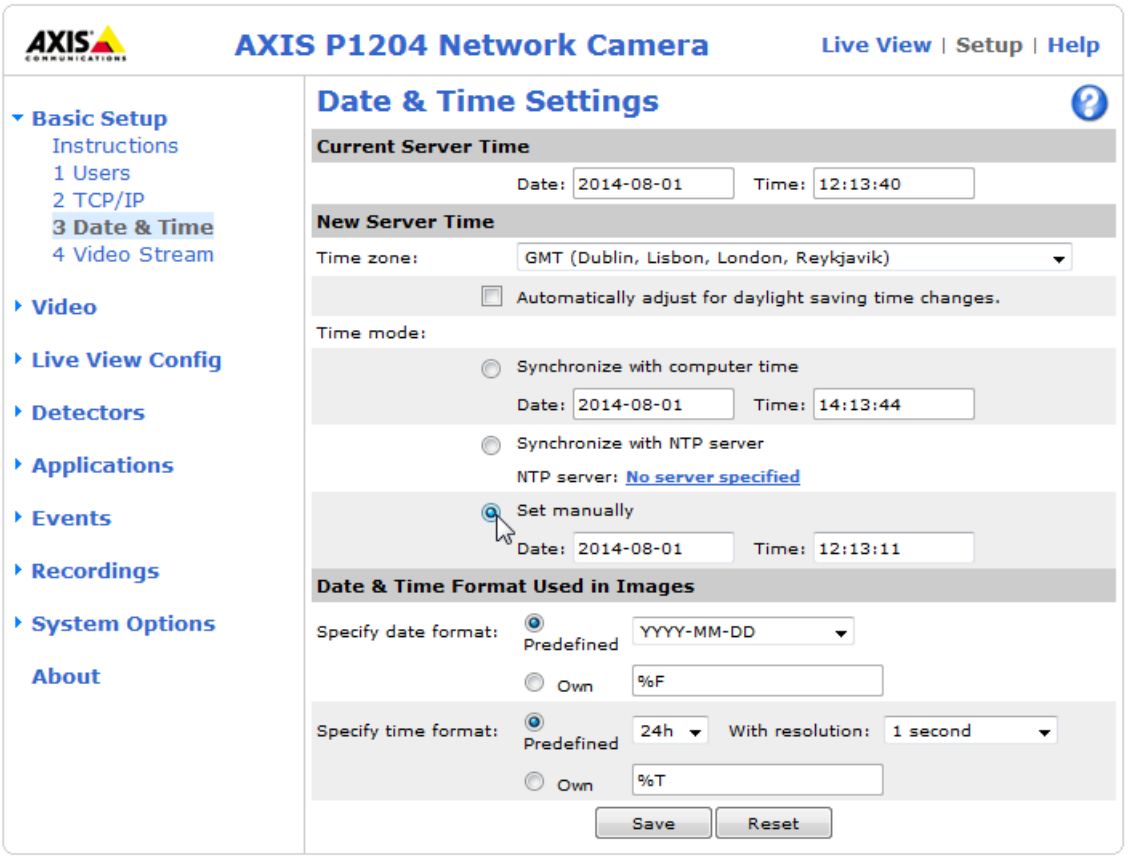


Figure 7.8: Set date and time manually

You can also display date and time on the video image.

Attention:
Before you start recording always set the date and time in the data logger first.
It is impossible to change the timestamp at recorded video data. This means, the setup of a new logger time before downloading does not change the time within the video pictures. In this case, the timestamps of the other channels and the video picture timestamp could not match.

Click **[Video]** → **[Video Stream]**. Activate both checkboxes **Include date** and **Include time** to activate the display on the video image. Confirm the settings with **[Save]**.

If desired, change format options like <Text color>, <Text background color> and text place. Confirm the settings with **[Save]**.

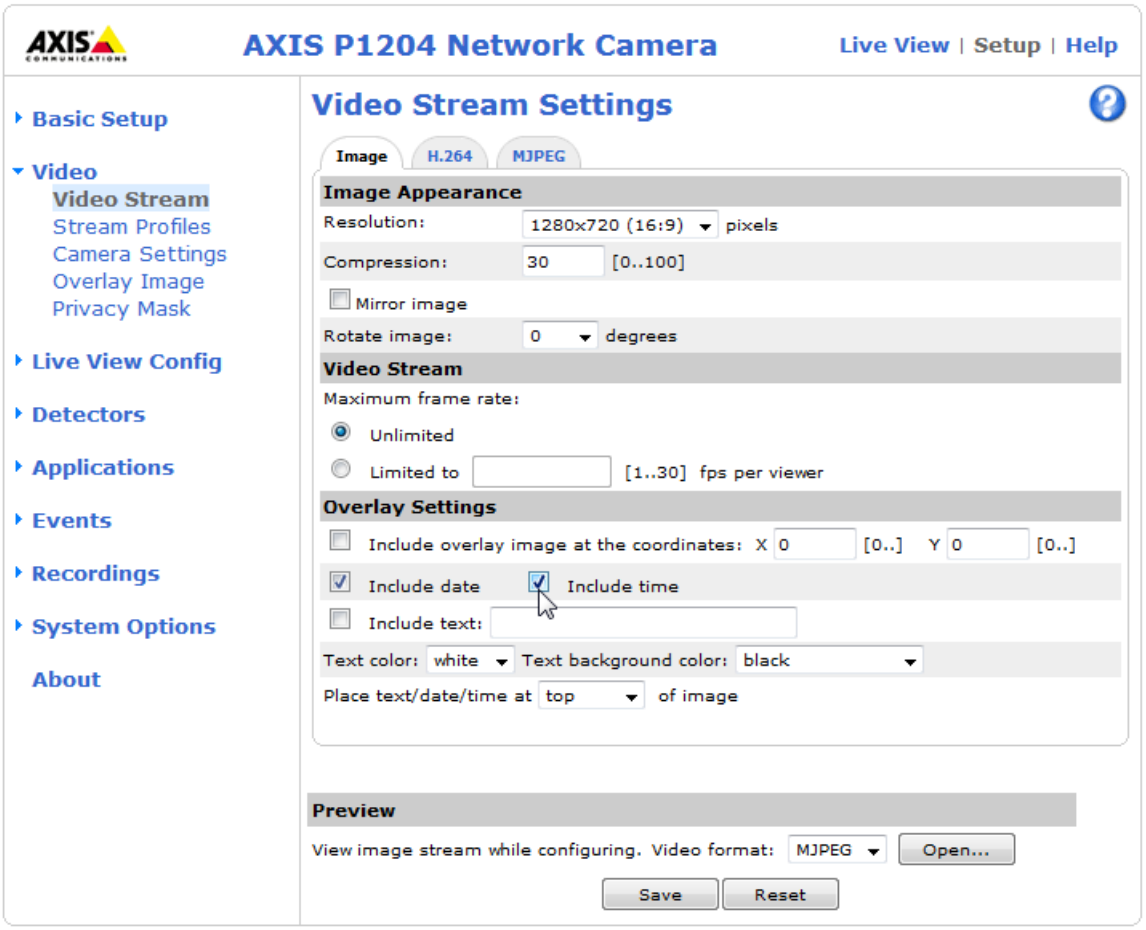

Figure 7.9: Include date and time in the video stream

The setup for in the video image embedded timestamps is finished.

Note:
In case that the video is stuttering or has breaks, please reduce the preset <Maximum frame rate>. Reducing to 15 or 20 fps eliminates the problem which is caused by to high frame rates especially with HD cameras.

Index

7.5 IP configuration

Change to the entry **[Basic Setup]** → **[2 TCP/IP]**. Choose the <IPv4 Address Configuration> **(o) Use the following IP address**. Type in these data:

IP address:	192.168.1.90
Subnet mask:	255.255.255.0

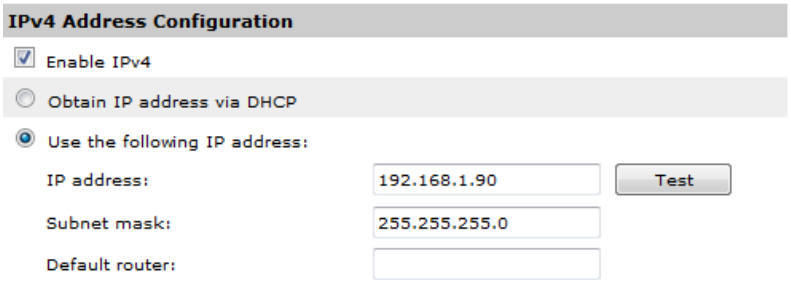

Figure 7.10: Setting an IP address

Confirm the settings with **[Save]**.

Note:
By changing the IP address you lose the connection to the network camera.

This also will be told to you in an information window:

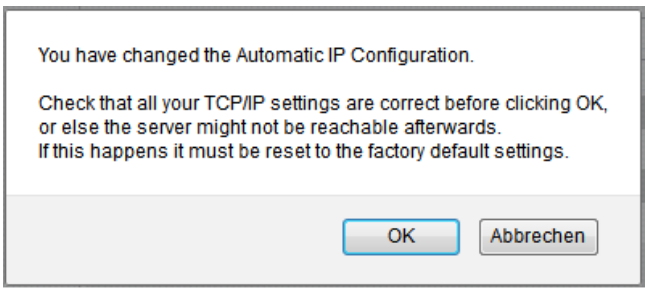

Figure 7.11: popup window 1

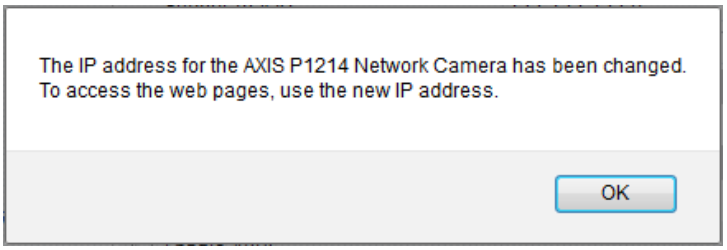

Figure 7.12: popup window 2

For reconnecting you have to change your computers IP address to **192.168.1.80**. Then type in your browser the new IP address of the network camera, to access the configuration again.

(http://192.168.1.90)

Note:
Finally, change your PCs or laptops IP configuration back to dynamic configuration.

7.6 Resetting configuration

The AXIS P-series can be set to default settings by the following steps:

5. Disconnect the connection to the power supply.
6. Press and hold the control button next to the PWR connector and
7. reconnect to the power supply.
8. Hold the control button for 15 to 30 seconds till the Stat-LED flashes yellow.

When the Stat-LED turns green the process is finished.

Index

8 Configuring the network camera AXIS 207/210/211

Warning:
The camera must have installed the firmware version 4.40. If there is another firmware version installed it is recommended to install the 4.40.

Any camera that is used with the data loggers BLUEPIRAT2 / BLUEPIRAT2 5E / BLUEPIRAT Mini can be installed manually or automatically (recommended).

The manual configuration is done over the camera web interface.

The automatic configuration is done with the program “AXIS Camera Management”. For this variant a template is available.

8.1 Related manuals

- AXIS 207 User Manual **[1]**
- AXIS 210 User Manual **[2]**
- AXIS 211 User Manual **[3]**

8.2 Automatic configuration (recommended)

Needed software: AXIS Camera Management v2.00.31
http://www.axis.com/techsup/software/index.htm or
http://www.axis.com/de/products/cam_mgmt_software/interface.htm

Configuration steps:

9. Check firmware version. Recommended: 4.40 (more information see **[1]**, **[2]**, **[3]** or AXIS online).
10. Resetting camera to the factory default settings (more information see **[1]**, **[2]** or **[3]** chapter “Resetting to the Factory Default Settings“).
11. Connect the camera with the PC / laptop via an Ethernet cable.
12. Set the password (more information see **[1]**, **[2]** or **[3]** chapter “Set the password“).
13. Install camera template by using the program “AXIS Camera Management“.
14. Add administrator.

Index

8.2.1 Installing the camera template

The template “BLUEPIRAT_Kamera_AXIS-ConfigTemplate_vX.X.cmt” configures your camera automatically. The download file is available in our ServiceCenter at **[BLUEPIRAT] → [Dokumentations]** under the manual of the camera connection.

15. Click **[Apply Template]**.
16. Click on the template file in the shortcut menu or choose it from the memory location with **[Browse…]**.

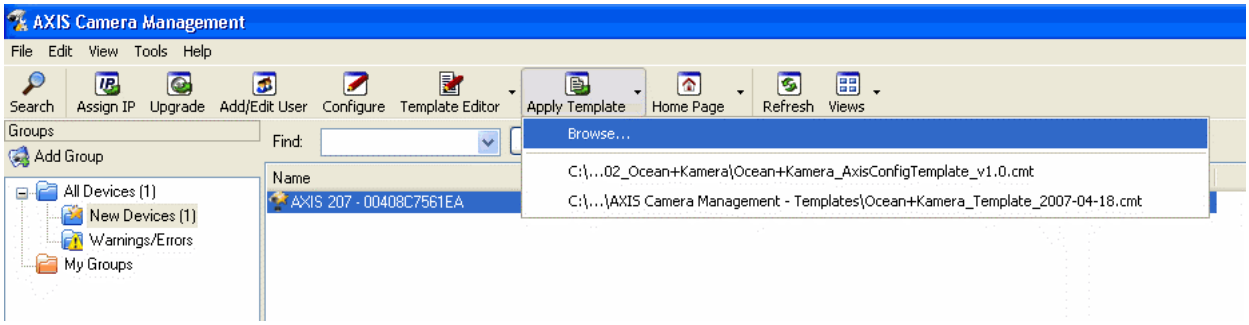

Figure 8.1: Select a template

A dialog opens:

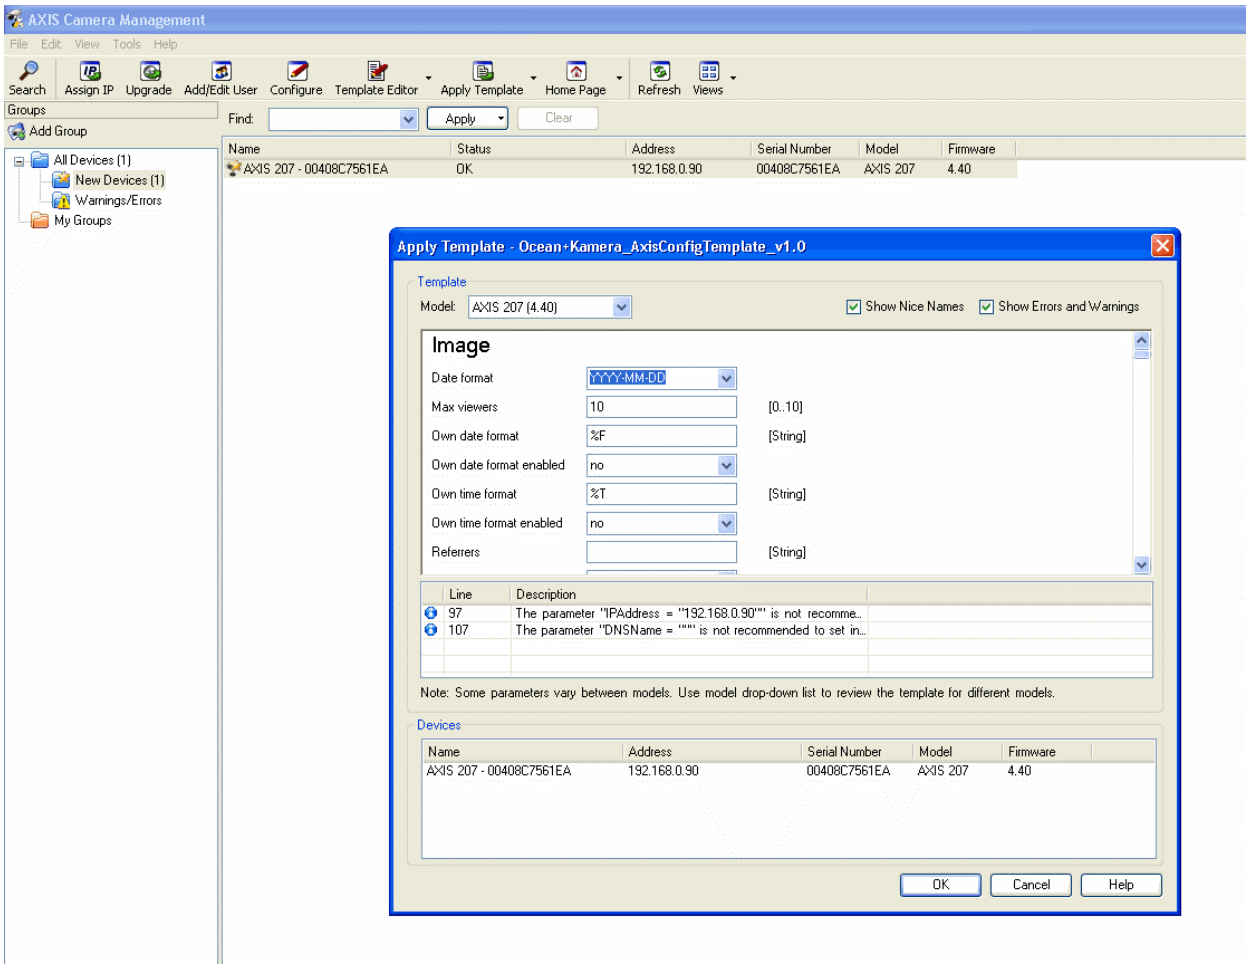

Figure 8.2: Apply template

17. Click **[OK]** to confirm the template.

A dialog opens.

18. Check the configuration process.

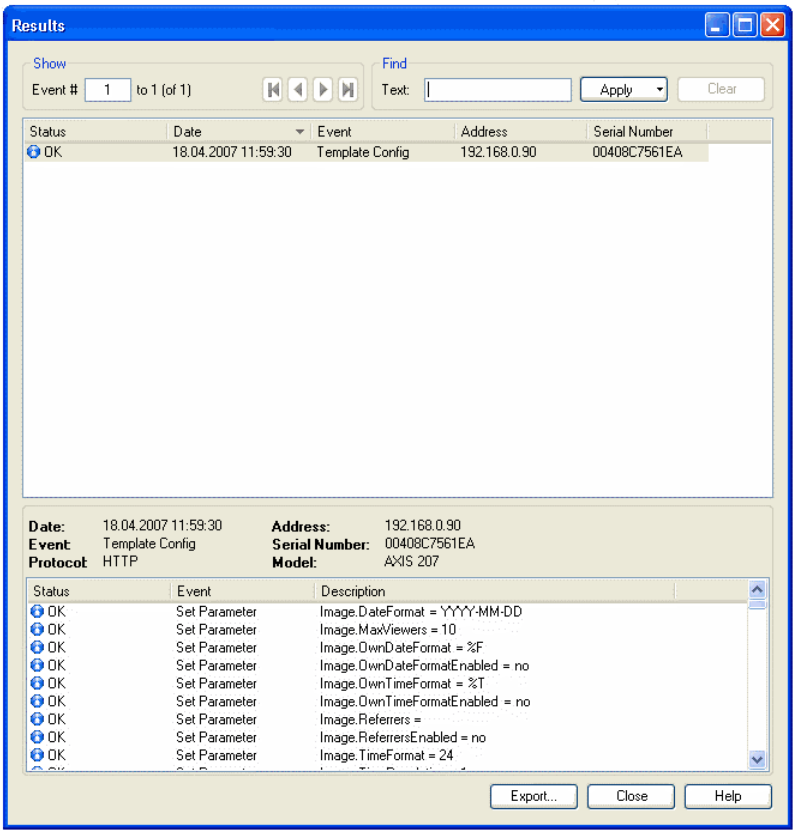

Figure 8.3: Result of the configuration process

8.2.2 Creating the user “admin”

For communicating with the data logger a special user is needed with administrator rights.

19. Click the configured AXIS camera with the right mouse button.
20. Click **[User Management]** → **[Add/Edit User…]** in the shortcut menu.

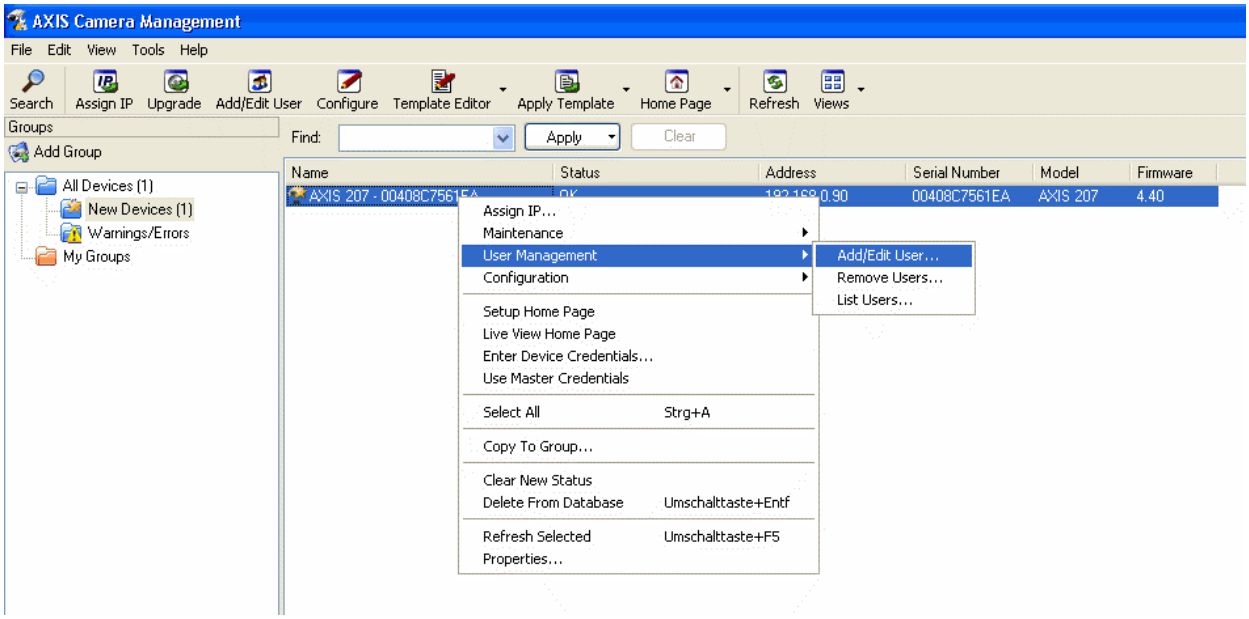

Figure 8.4: Add a user

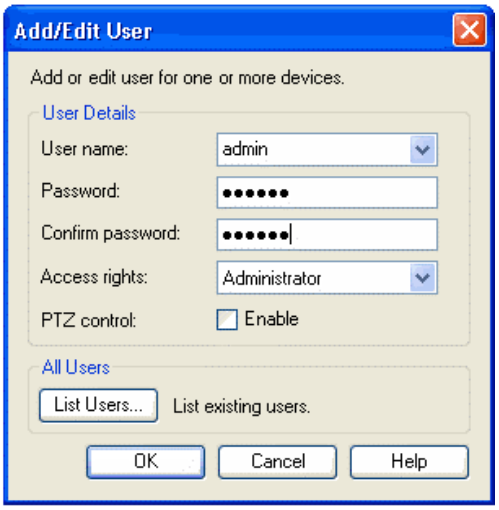
A dialog opens.

21. Add administrator as follows:



Name the new user “admin” and define a password. This user and password will be needed later too.

Recommended:
User name: admin
Password: 2x8bg4

Choose the <Access rights> “Administrator” and click **[OK]**.

Figure 8.5: Select a user password

8.3 Manual configuration

22. Reset camera to the factory default settings.
23. Connect camera with the PC / laptop via an Ethernet cable.
24. Open browser.
25. Type in the preset IP address of the network camera: **192.168.0.90**.
26. Press **[Enter]**.
27. Click **[Setup]**.
28. Add administrator.

If you don't know the cameras IP address, use the program “IP-Utility” on the AXIS CD-ROM for detection.

If it is still not possible to connect to the camera setup, please reset the camera via hardware reset. This is described in the camera manual. In this case you have to use the fix IP address 192.168.0.10 for your PC. The camera is reachable by the IP address 192.168.0.90.

A step by step configuration of the camera is described in the section below.

The following instructions are illustrated by screenshots of the camera setup of the AXIS 210. The layout of the other supported cameras 207, 207W and 211 can differ.

Note:
All modifications of one setup screen must be applied by the [Save] button. Otherwise the changes will be discarded.

8.3.1 Resetting configuration

The camera AXIS 207/210/211 can be set to default settings at **[System Options]** → **[Maintenance]** with the **[Default]** button under <Maintain Server>.

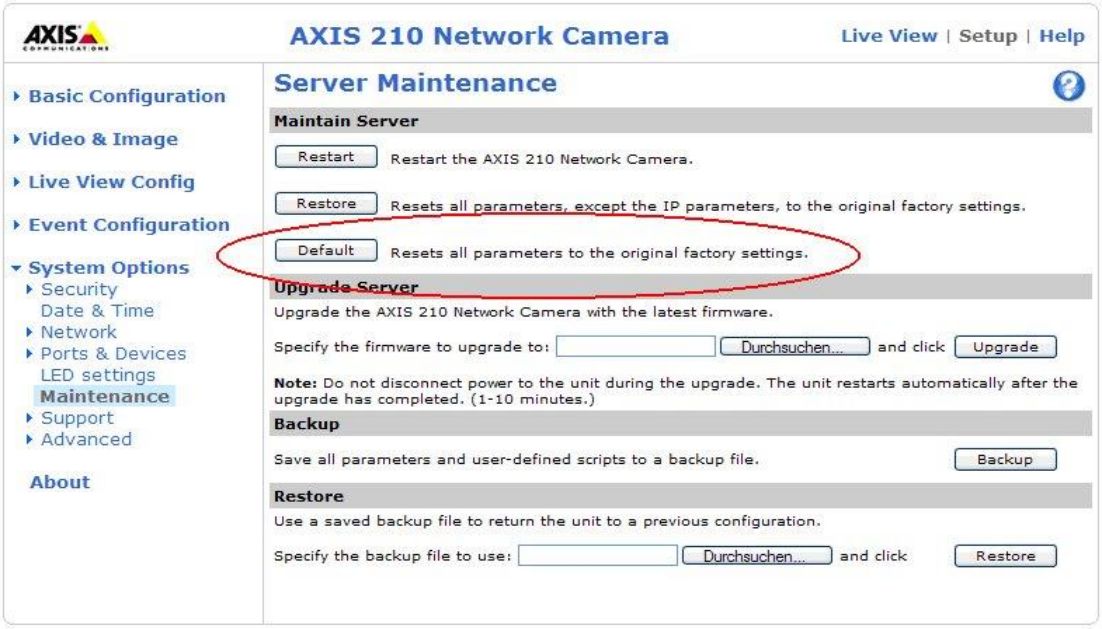

Figure 8.6: Reset configuration

Index

8.3.2 IP configuration

Change to the entry **[Basic Configuration]** → **[2. TCP/IP]**. Choose the <IPv4 Address Configuration> **(o) Use the following IP address**. Type in these data:

IP address:	192.168.1.90
Subnet mask:	255.255.255.0
Default router:	192.168.1.1

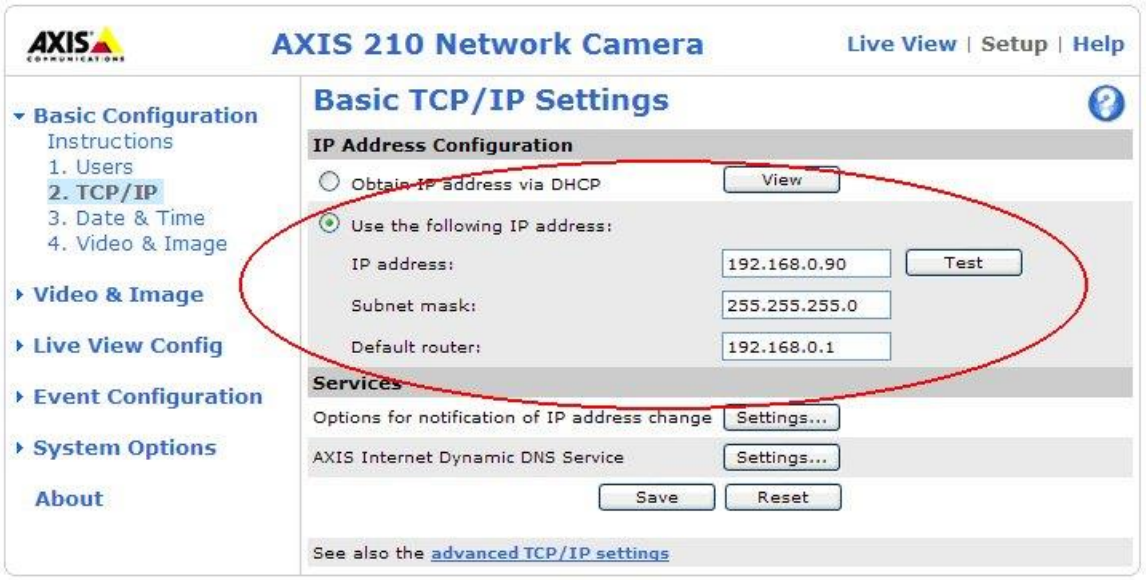

Figure 8.7: Setting an IP address

Note:
When using a port on the rear side of the logger, please type in the <IP address> 192.168.0.90 and the <Default router> 192.168.0.1.
The same IP address has to be used in the data loggers configuration.

Confirm the settings with **[Save]**.

Note:
By changing the IP address you lose the connection to the network camera.

This also will be told to you in an information window:

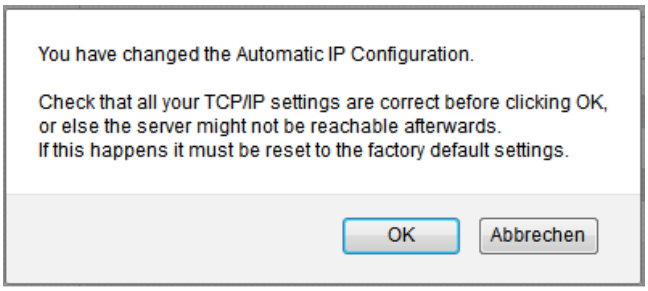

Figure 8.8: Hint 1

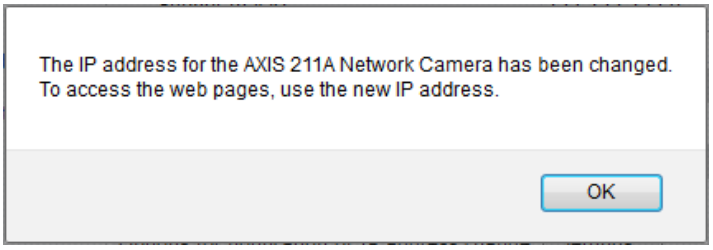

Figure 8.9: Hint 2

For reconnecting you have to change your computers IP address to **192.168.1.80**. Then type in your browser the new IP address of the network camera, to access the configuration again.

Note:
Finally, change your PCs or laptops IP configuration back to dynamic configuration.

8.3.3 Creating the user “admin”

For communicating with the data logger a special user is needed with administrator rights.

Click **[Setup]** → **[Basic Configuration]** → **[1. Users]** → **[Add…]**.

A new window is opened.

Name the new user “admin” and define a password. This user and password will be needed later too.

Recommended:
User name: admin
Password: 2x8bg4

Choose the <User group> **(o) Administrator** and click **[OK]**.

Activate at <User Settings> the checkbox **Enable anonymous viewer login (no user name or password required)**. Confirm the settings with **[Save]**.

Note:
If you want to use an individual password for the camera, you have to deactivate this checkbox. Now you can change the password for the user “admin” individually.
This password has also to be configured in the client.

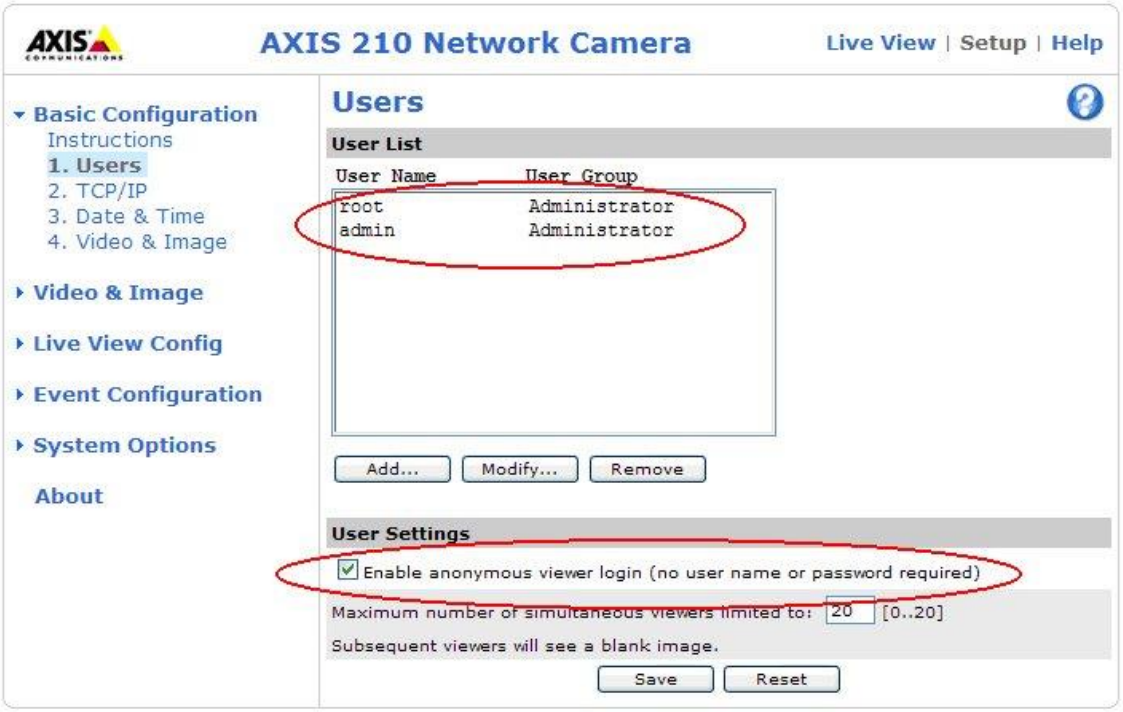

Figure 8.10: Enable anonymous viewer login

The setup for in the video image embedded timestamps is finished.

Note:
In case that the video is stuttering or has breaks, please reduce the preset <Maximum frame rate>. Reducing to 15 or 20 fps eliminates the problem which is caused by to high frame rates especially with HD cameras.

Index

10.5 IP configuration

Change to the entry **[Basic Setup]** → **[2 TCP/IP]** **(3)**. Choose the <IPv4 Address Configuration> **(o) Use the following IP address** **(4)**. Type in these data **(5)**:

IP address:	192.168.1.90
Subnet mask:	255.255.255.0

Confirm the settings with **[Save]** **(6)**.

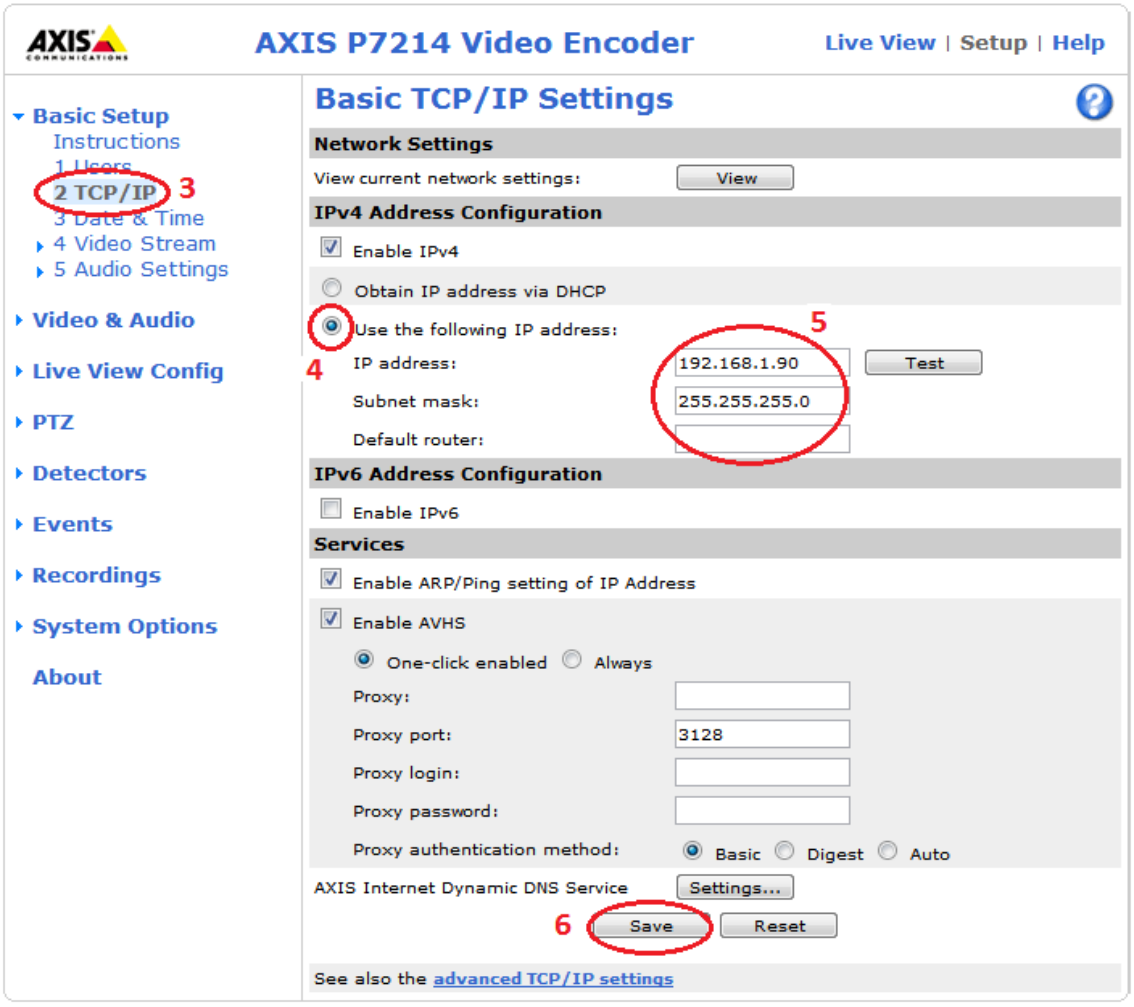

Figure 10.11: Setting an IP address

Note:
The video server AXIS P7214 has only one IP address. The camera configuration automatically changes the settings of the other cameras. It is therefore unnecessary to set the other cameras.

Note:
By changing the IP address you lose the connection to the video server.

This also will be told to you in an information window:

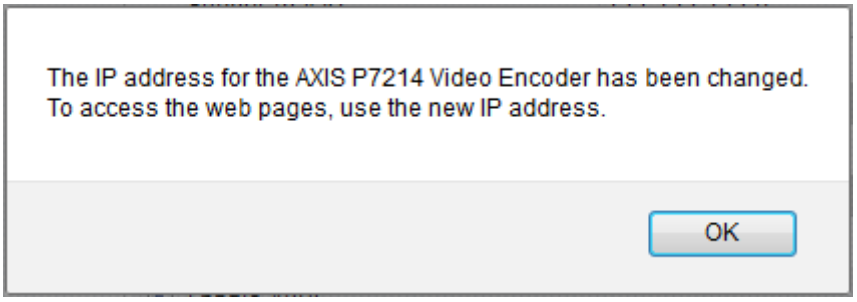

Figure 10.12: Hint

For reconnecting you have to change your computers IP address to **192.168.1.80**. Then type in your browser the new IP address of the network camera, to access the configuration again.

Note:
Finally, change your PCs or laptops IP configuration back to dynamic configuration.

Index

11 Save and restore the Video Encoder settings

To save all settings of the AXIS video server you can use the program “AXIS Camera Management”, which can be downloaded on the website of AXIS (registration required).

Needed software: AXIS Camera Management v2.00.31
http://www.axis.com/techsup/software/index.htm or
http://www.axis.com/de/products/cam_mgmt_software/interface.htm

Attention:
If you use a newer version of the program it may be that the communication between software client and data logger is disturbed. That is because the program changes some network settings, so UDP pings are not correctly transferred from the logger to the AXIS Camera Management Client.
In this case the older version (mentioned above) should be used or the program should be uninstalled after the saving.

After installing the software you can start it by using **[Start]** → **[AXIS Camera Management]** → **[AXIS Camera Management Client]**.

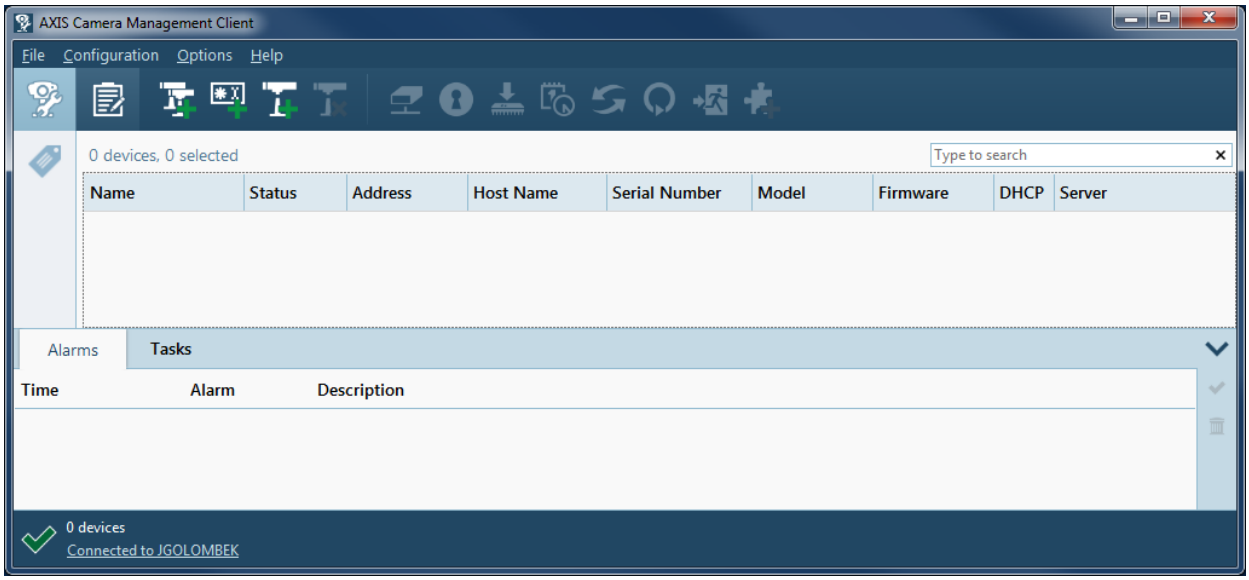

Figure 11.1: AXIS Camera Management Client

You can add your device by clicking **[Add devices]**.

Figure 11.2: Adding devices step 1

After selecting your device and logging in with your chosen password for the user “root” from before you add the device to the device list with **[Next >]** and **[Finish]** in the next window.

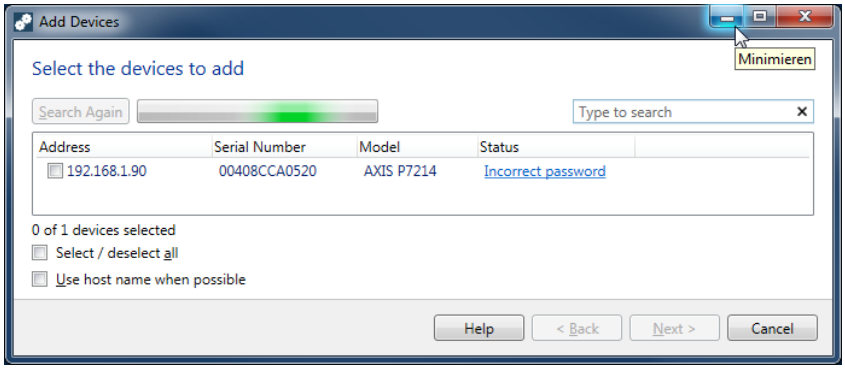

Figure 11.3: Adding devices step 2

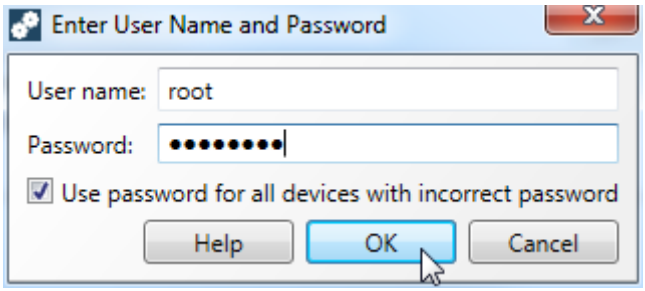

Figure 11.4: Adding devices step 3

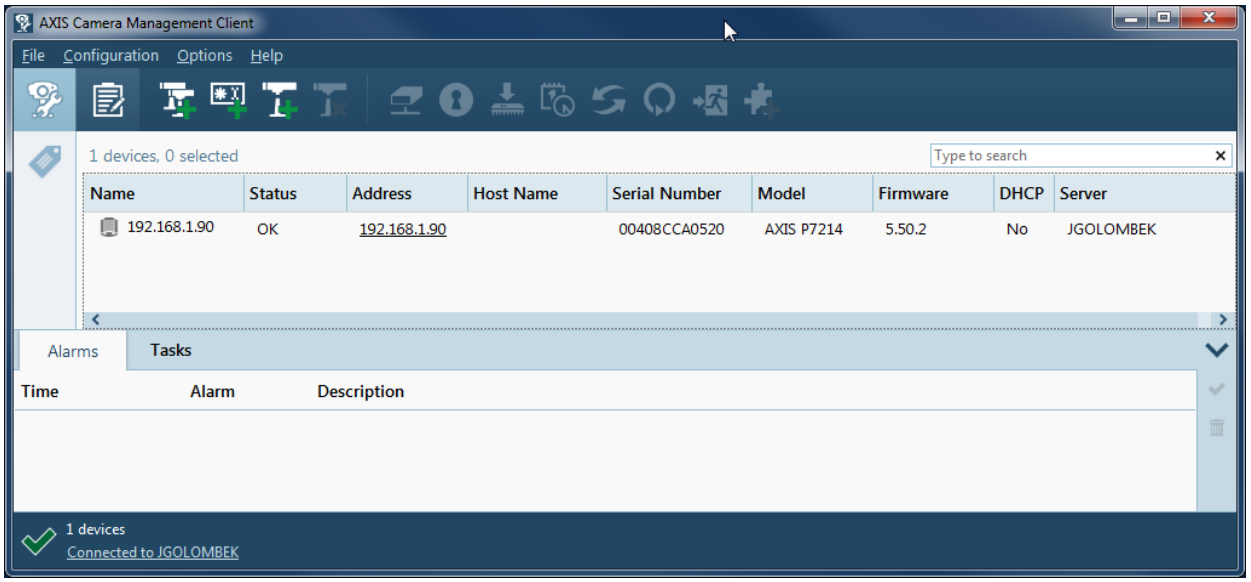

Figure 11.5: Device added

To save the current settings please right click your device. In the shortcut menu select **[Parameter Management] → [Create Parameter File…]**.

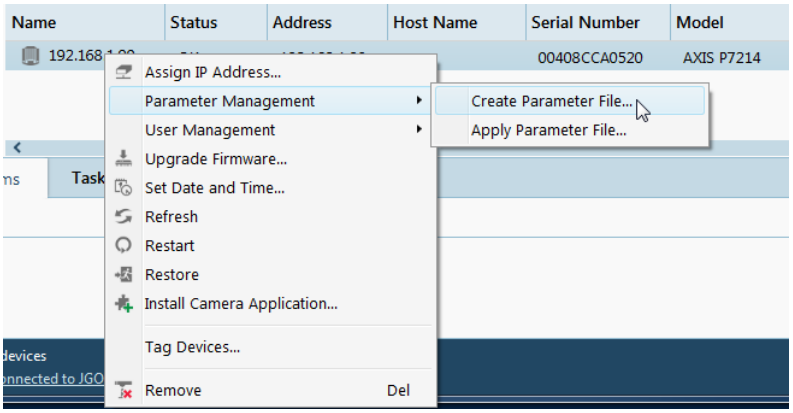

Figure 11.6: Creating Parameter File

The program reads the configuration from the video server. Activate the checkbox **Select / De-select all** and then click **[Save]** to save the configuration to your local system.

To restore the saved settings to your device select **[Parameter Management]** → **[Apply Parameter File…]** in the shortcut menu of the device.

12 Resetting the Video Encoder AXIS Q7404 / P7214

If something is configured incorrectly in the camera or the password is lost, it is important to reset the video server for a new configuration. This will reset all parameters in all four video channels (including all IP addresses) to the factory default settings.

First disconnect the power supply from the AXIS Video Encoder. Then press and hold the **[RESET]** button **(1)** while reconnecting with the power supply.

AXIS Q7404

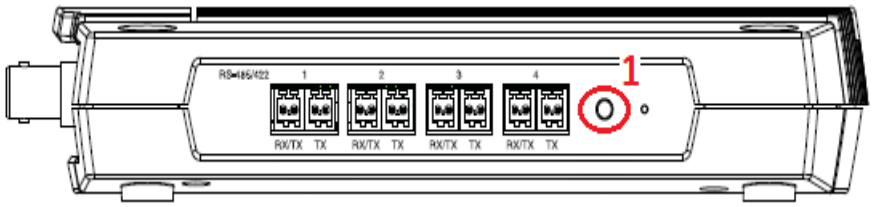

Figure 12.1: Reset button AXIS Q7404

AXIS P7214

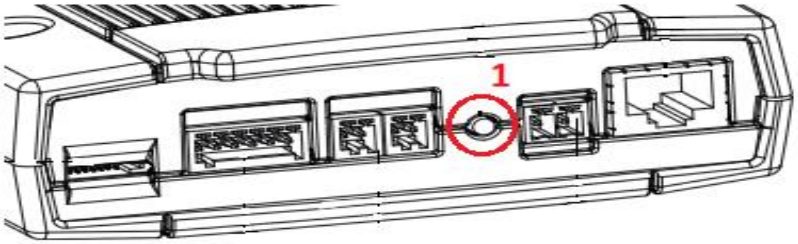

Figure 12.2: Reset button AXIS P7214

Keep the **[RESET]** button **(1)** pressed.
The STATUS LED turns yellow. This may take up to 15 seconds.

Release the **[RESET]** button **(1)** when the STATUS LED lights permanently green. This may take up to one minute.

The video server is set back to factory default settings and can be configured again.

Index

13 Connecting video equipment to the data logger

Depending on the logger model you have several ways to connect the network camera or Video Encoder to the logger.

BLUEPIRAT Mini: It is possible to use one of the front Ethernet ports (**ETH #1 / TSL** or **ETH #2 / TSL**) or one of the back ports (**ETH #3** or **ETH #4**).

BLUEPIRAT2 5E: It is possible to use the front Ethernet port (**ETH #1 / TSL**) or one of the back ports (**ETH #2** to **ETH #5**).

BLUEPIRAT2: It is possible to use the **Gigabit-Ethernet** port on the front side or the **Ethernet kit** on the back.

At the BLUEPIRAT2 / BLUEPIRAT2 5E the back ports should be preferred. In this case the front port still can be used for access to the logger while the Video Encoder is recording data. This alternative is described in the following.

Connect the Gigabit-Ethernet port of the logger via an Ethernet cable with the Ethernet port of your PC / laptop. The data logger is configured as a DHCP server by default.
Connect the logger via the affiliated power harness (**red/+/clamp 30** and **black/-/clamp 31**) with a power supply (e.g., the vehicle battery).
Connect the Ethernet kit with the FCI port of the BLUEPIRAT2 (rear side). Connect the Ethernet kit with the network camera or the Video Encoder.
When using a Video Encoder the network camera can be connected to its BNC connector number 1. Connect the Video Encoder and if required even the network camera to the according power supply. The Video Encoder is starting. Wait until all its LEDs turn green.

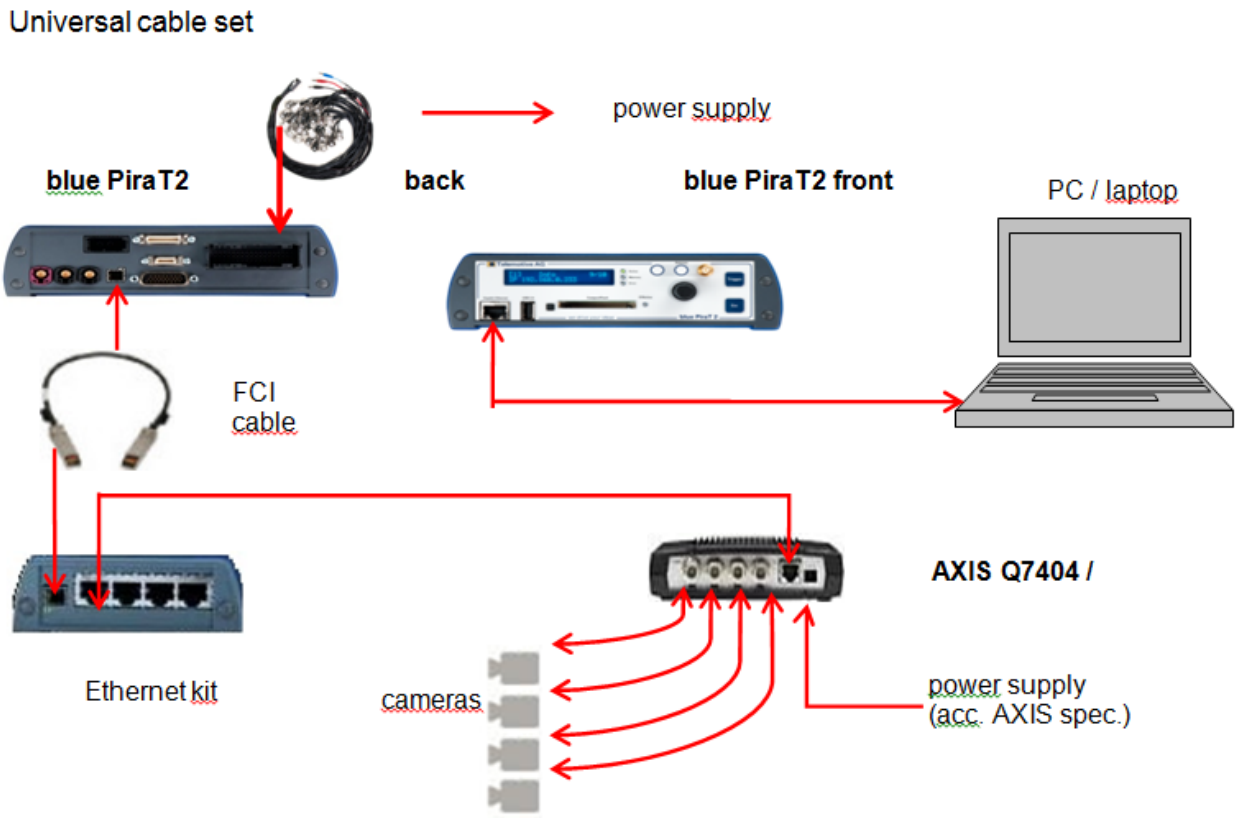

Figure 13.1: Connecting video equipment to a data logger

14 Configuring the data logger

14.1 General settings

The logger should be configured as DHCP server, if it is not already configured accordingly (default value).

Therefore click on the application **[Open configuration]** (5) in the System Client. Expand the folder **[General]** in the window to the right and click on **[Network settings]**. Enable the <DHCP mode> **(o) DHCP server** or **(o) Automatic DHCP Configuration for TSL.**

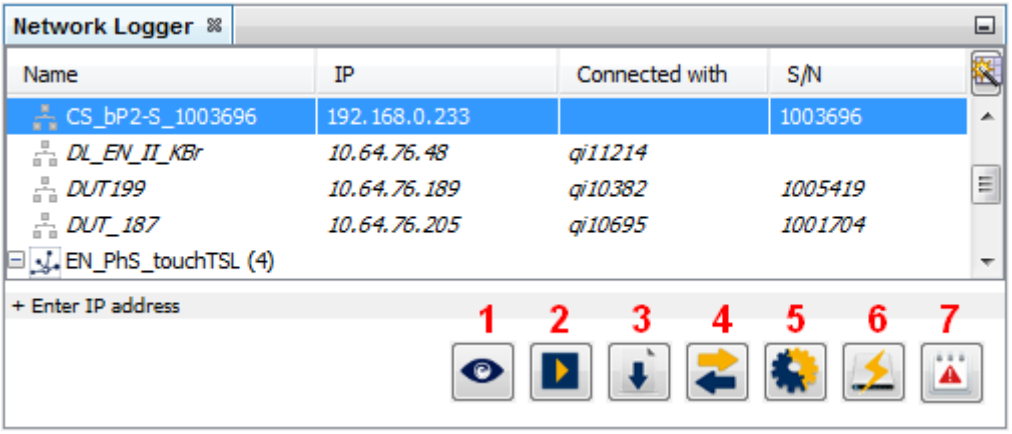

Figure 14.1: Selecting an application in the System Client

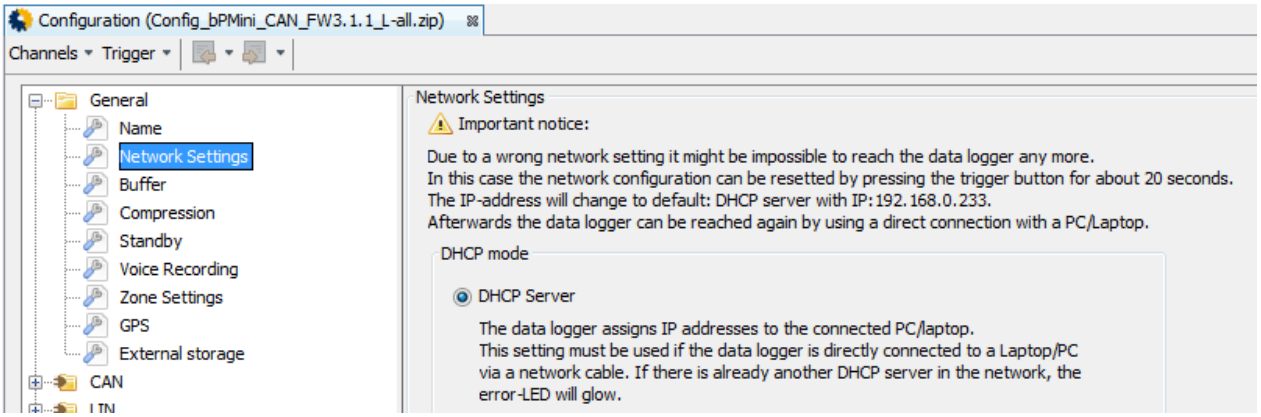

Figure 14.2: Setting the network settings in the System Client

Please be sure about the setting of the logger's standby.

You can activate or deactivate the automatic standby at **[General]** → **[Standby]**. If active, there are two different time settings for network connection.
If the data logger is not connected to a network at the front Ethernet port and does not receive any data during the timeout entered in the upper text field, then it shuts down and enters standby mode.
If the data logger is connected to a network at the front Ethernet port with active link and does not receive any data during the timeout entered in the lower text field, then it shuts down and enters standby mode.

This has important implications when using the camera function since Ethernet is required. If you activated the automatic standby, no further channels are connected or they are inactive, the logger shuts down and enters standby mode according to the lower time indication despite the video recording. So you have two options:

- Deactivating the automatic standby and shifting the device to standby manually, if necessary or
- Configuring a channel (e.g., CAN channel), whose activity coincides with the camera activity.

14.2 Camera settings

14.2.1 Camera | General settings

Click on the application **[Open configuration]** in the System Client. Expand the folder **[Camera]** in the window to the right and click on **[General settings]**.

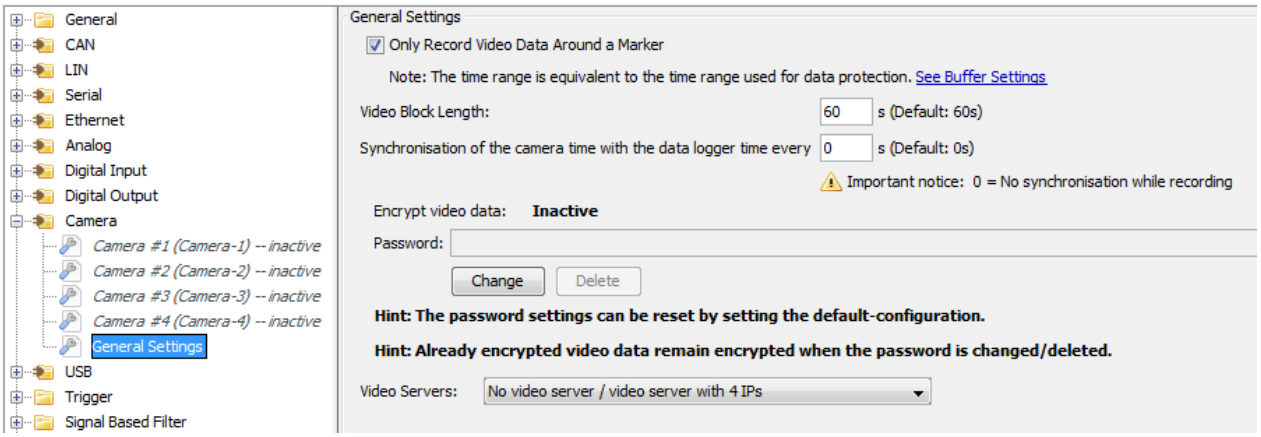

Figure 14.3: Camera => General settings

If the checkbox for **Only record video data around a Marker** is:

- activated: the logger records no data, except these around a Marker.
- deactivated: the logger always records all video data.

You can define the time range around a marker under **[General]** => **[Buffer]:**

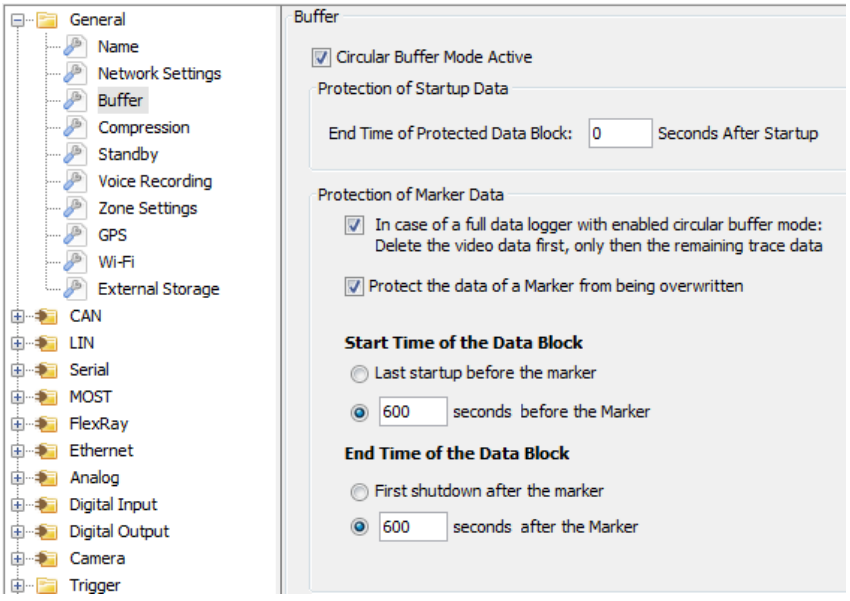

Figure 14.4: Setting the time range around a marker

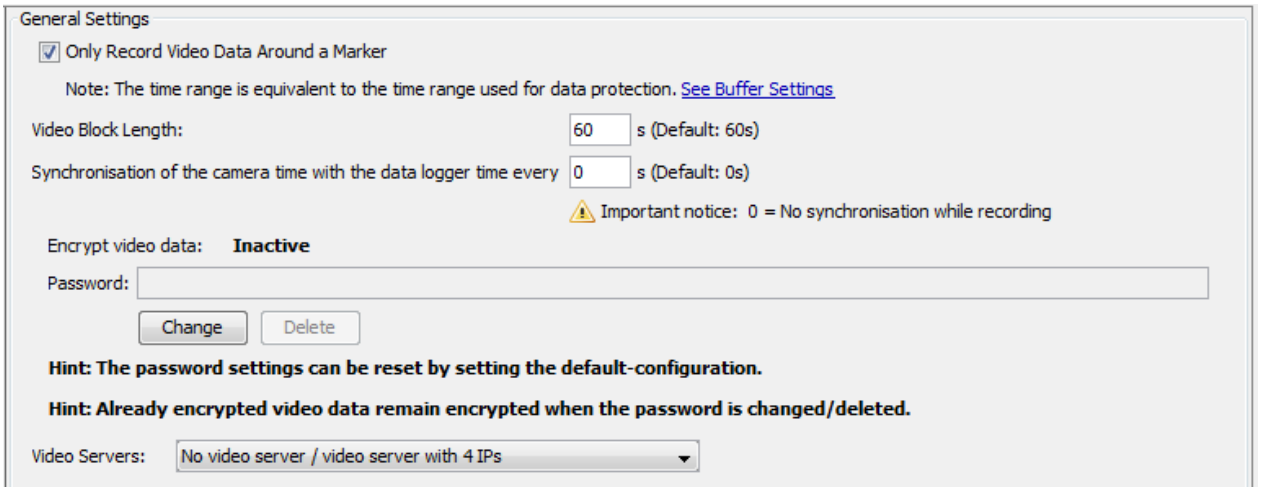

Figure 14.5: Camera => General settings

To record video blocks of certain length, type in your desired value in seconds at <**Video block length**>.

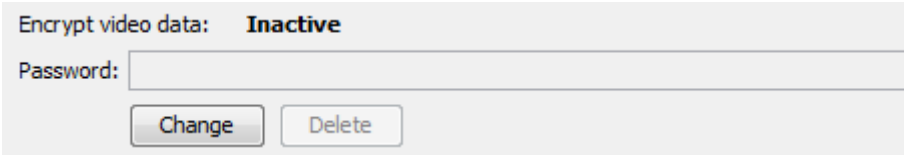
The field <**Synchronisation of the camera time with the data logger time every [ ] s**> allows defining his time range.

Note:
If there are some gaps in the recording it may be caused by this synchronisation. In this case please deactivate the synchronization by inserting *0* into the field.

If you use more than one single camera like Axis 207/210/211 the synchonisation must be enabled to guarantee a synchronised recording of all cameras.

14.2.1.1 Encrypting video data

If the video data should be encrypted, the Client offers the possibility to set, change or delete a password in this field:



14.2.1.2 Setting the video server

In the dropdown menu at <**Video Servers**> select the connected network camera / Video Encoder. The following options are available:

Option 1: No video server / video server with 4 IPs
AXIS Q7404 / 207 / 210 / 211 / P12 series / F41

Option 2: Video server with one IP and 4 channels
AXIS P7214 / F44

Option 3: Video server with one IP and one *quad* channel
AXIS P7214 / F44

Note:
Quad channel means that up to 4 video streams are recorded in one window.

Attention:
With the setting Quad-View, the same maximum frame rate must be set for all cameras! You can find this setting in the camera configuration under Axis Setup => Basic Setup => Video Stream => Camera 1, Camera 2,... At different frame rates, otherwise connection breaks may occur.

If you select **option 2** or **3**, please type the IP address of the AXIS P7214 / F44 in the approaching fields below.

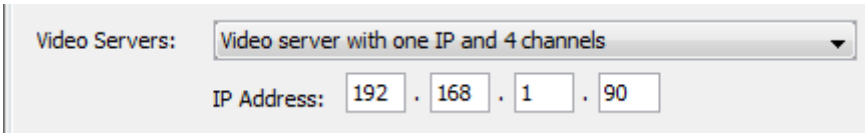


Figure 14.6: Setting an IP address

14.2.1.3 Configuring the cameras

In the folder **[Camera]** click **[Camera #1]** **(1)** and activate the checkbox for **Camera interface active** **(2)**. Choose the connector **(3)** depending on the Ethernet port the Video Encoder / network camera is connected to. Enter the Video Encoders / network cameras IP address **(4)**. If the AXIS P7214 is used, the IP address is already specified in the general settings. It is taken from there.

If you have chosen to use the recommended user and password, you can activate the checkbox for **Default password** **(5)**.

If you have chosen to use your own password, deactivate the checkbox for **Default password** **(5)** and type in your chosen “admin” password from before **(6)**.

Type in the additional IP-alias of the data logger **(7)**. The data logger has to be in the same subnet as the Video Encoder / network camera.

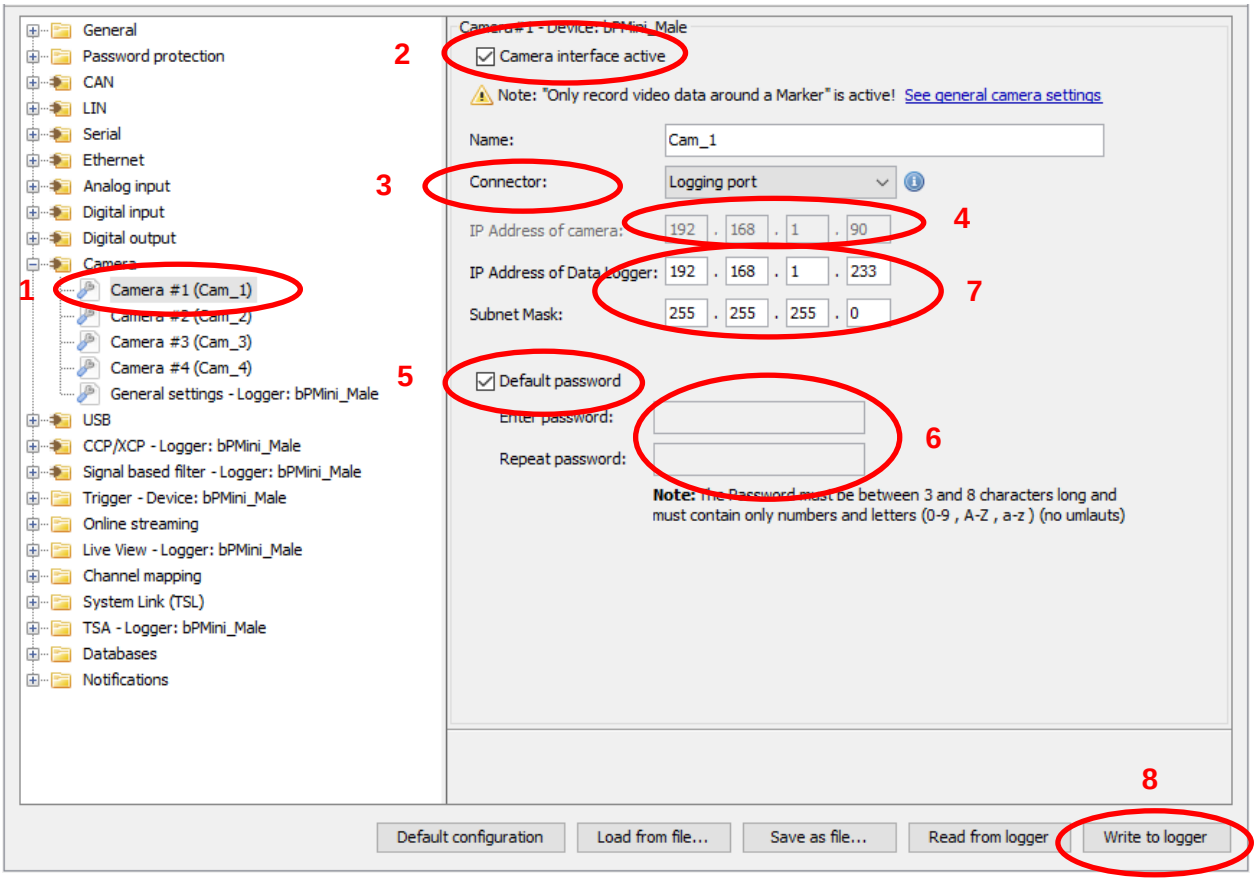

Figure 14.7: Configuring the cameras

If you have selected 
under **[General],** make the same changes for all connected cameras with the following IP addresses:

	Camera 1	Camera 2	Camera 3	Camera 4
AXIS Q7404, 207, 210, 211 AXIS P1204, F41	192.168.1.90	192.168.1.91	192.168.1.92	192.168.1.93
AXIS P7214, F44, FA54	192.168.1.90	192.168.1.90	192.168.1.90	192.168.1.90

After setup click on the button **[Write to logger]** (8).

The configuration is finished. The logger starts recording the video signal as configured.

Index

14.3 Front display of BLUEPIRAT2

With the **[OFF / Esc]** button at the front of the data logger the main window appears on the display. By switching the rotary knob you can change the displayed interfaces. There you can see the configuration of the four cameras, represented by “VID” and meaning video. Each sign after the word “VID” is placed for one video channel.

Three cases are listed:

Case 1
“–” means, the camera license is installed but no configuration has been performed. All four channels are however recognized.

Figure14.8: Display: VID ----

Case 2
„X“ means, all parameters are configured. The video data are not recorded or there is no connection between logger and server. The following figure shows that camera 1 and 2 are configured but not recorded and camera 3 and 4 are not activated.

Figure14.9: Display: VID XX--

Case 3
„T“ means, logger and server are connected and the videos are recorded. The following figure shows that camera 1 and 2 are recording and camera 3 and 4 are not configured.

Figure14.10: Display: VID TT--

Does the data recording runs without errors, there should always be shown a “T” (Traffic).

15 Downloading video data

The System Client application allows downloading and saving the recorded data as offline data set from the logger on the computers disk to use it later or to convert the data directly from the logger. (see chapter 16)

Download and conversion of data is explained in detail in the **System Client User Guide**. This manual you can find in the ServiceCenter of MAGNA Telemotive GmbH or directly under this link:

https://sc.telemotive.de/4/uploads/media/TelemotiveSystemClient_UserManual.pdf

While all of the other trace files are recorded in the Telemotive format from the logger, video signals are directly provided as MPEG4 stream from the camera and saved as it is on the logger.

For the video application, there is a special characteristic about the video block length. If you select a time period or a marker for download, so the downloaded data does not match exactly to the expected start- and end time. The reason is that the video block length of 60 seconds does not match exactly to the selected download time. The system always downloads complete video blocks. The downloaded video is in all cases longer than selected. It starts earlier and ends later than the selected period. But the selected time is always included.

Index

16 Converting video data

The System Client additionally allows to save data from the logger in a requested format on a PC or external storage device. Because video signals are directly provided as MPEG4 stream there is no direct conversion possible.

This document describes only the specifics for the video conversion.

The conversion can left the video blocks separate (untouched) or converted to one video file. Choose the required option in the client output window **(4)**.

For both options the result will be the ".mpeg4" video format.

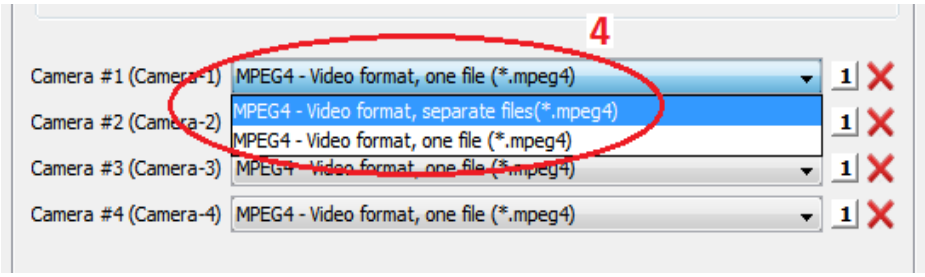

Figure 16.1: Settings for converting video data in the System Client

The System Client can also convert offline data, which are downloaded already from the data logger. Only an installed client is necessary.

In the tab <Favorites> click the green **[+]** **(1)** and choose the main download folder. The download folder appears **(2)**. Double clicking the main folder **(3)** will open the conversion tab.

Figure 16.2: Choose an offline dataset

Like this you can convert every part of an offline data set at any time.

17 Watching videos

The .mpeg4 video files cannot be watched with the data logger. They can be used only if they have been downloaded or converted and saved to a computers disk first.

They can be played on any standard video player.

Note:
In case that the video is stuttering or has breaks, please reduce the preset <Maximum frame rate>. Reducing to 15 or 20 fps eliminates the problem which is caused by to high frame rates especially with HD cameras.

18 Axis IP Utility

is a small tool that you can download from the Axis Hompepage over the following link:

http://www.axis.com/global/en/support/downloads/axis-ip-utility

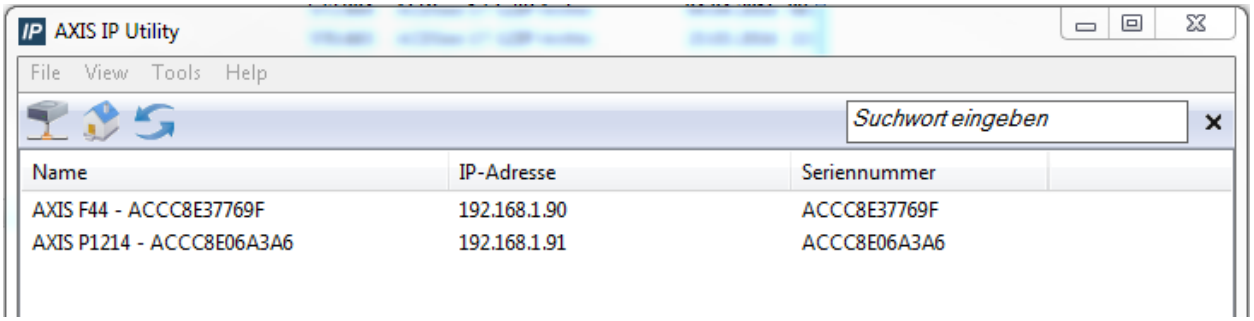

Figure 18.1: Axis IP Utility

AXIS IP Utility helps you set the IP address of an Axis network video product. Axis devices on the network are automatically discovered and displayed. Assign network parameters (IP Address, Subnet mask and Default router) or configure the device to obtain its IP address from DHCP.

The Axis device and the client computer must be on the same subnet/network segment.
