# 1 What are blue PiraT Licenses?

For certain functions of the blue PiraT data logger it is required to purchase a license. This license is always linked to one or more data loggers. By installing the license, the appropriate functions are activated.

## 2 Upgrading Data Loggers

If a customer already owns a data logger and wants to upgrade to a license, Telemotive AG needs the mainboard serial number of the data logger for which the license should be valid. The easiest way to determine this number is to run the program „Update firmware and licenses“ in the blue PiraT folder of the start menu.

*Up to Client version 3.0.0:* After pressing the button „Details...“ (see Figure 1), a window opens (see Figure 2) that displays the mainboard serial number at the top.

*Client version 3.1.0 and higher:* The program's main window displays the mainboard serial number (see Figure 3).

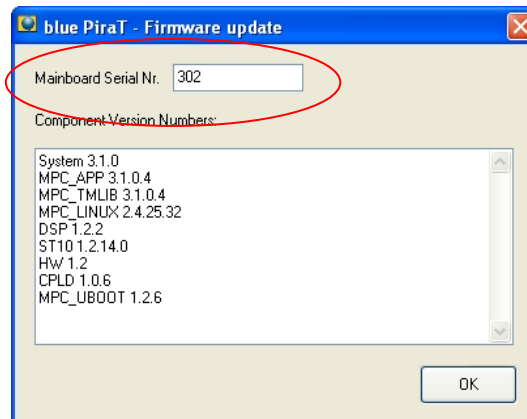

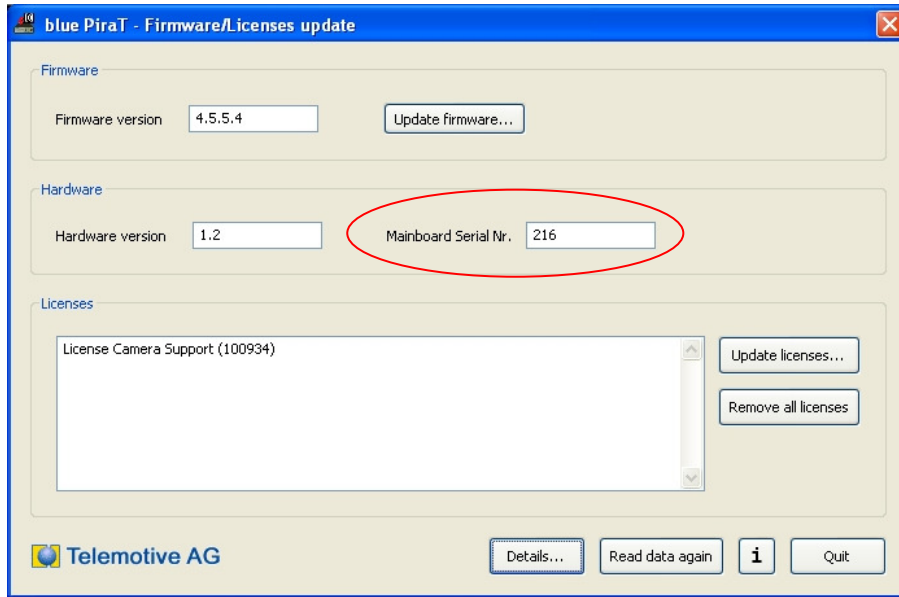

Figure 2. The mainboard serial number is shown in the “Details” dialog

## 3 Installing the License

The license is provided as a file, e.g. „Lizenz\_bluePiraT\_MB\_597.tml“. To install the license on the particular data logger, the program „Update firmware and licenses“ must be run. A dialog appears (see Figure 1 or Figure 3, respectively). All currently installed licenses are shown in the box next to the label „Licenses“. After selecting the button „Update licenses“ a file selector appears, where the provided license file must be located. The license file is then uploaded to the logger - the new function is available now. In the case the text „not supported by the current firmware“ is displayed next to the license, it is necessary to perform a firmware update first.
